## BLOO

BLOO
BLOO
with twelve tone of farm-dung. It ie now rarely ased in sugar-refining. It is used to make animal charcual in Prnssian-blue works, and also in some Turkey-red dye(Lizw.) Relstionship; stock; family. - Brotbera nnd aisters are satid to be of the whole-blood if they lave the same father and mother, and of the half-blood if they Lave obiy one pareut in comman
(Eccl. Hist.) Under the Old Testament dispensation, the life of all ummals was regarded as especially existing in the blond, which was a sacred and essential part of the the aitar and the mercy-seat, "for it is the bloud thint thaketh atoneutent for the sonl." It was therefore mon eacredly associated with the $B$. of the Lamb of God, which "cleanseth us from ull sin." Hence, the strict prohibition of the lsraelites to eat $B$., or any meat in which $B$. T mained, - a prohibition renewed in Acts $x \mathbf{v}$. 29. The Christian Chureh continued for some centuries to abstain from B.; and when it was alleged against them that they were in the way of drinking haman $B$, they replicd that it was not lawfal for chem to drme even the B. of suinals. After the the ceatary, how of a temperary character, and ceatsel to be binding
B1ood, v.a. Tu bleed; to let bloud from.-To stain or smear with blood.

He was broped up to the elbows by a coaple of Moors, Addizon.
-To inure or accustom to blood, as a honnd.

## Fairer thas fhireat. let note erer any. Tbat ye were blooded in a yielded prey.

-v. i. To bleed; to be bled.
-a. Pertainiog to blood; of the color of blood; of a auperior or particular blood; as, a blood-horso
Biodad, (Avenuer of,) (d-orn'jer.) (Hist.) In the early ages, the penalty of death for the crime of murder wats lut it wus considered the duty of the zuost immediat relative of the victim to hunt and slay the randerer The Hebrew word Goed signified the avenger of blood it had ulso a wider signification. The Musaic law placed this recognized institution of the rude social condition of the timee under certain regulations, probibited the mnrderer from purchasing by money a ransom for his ife, and appointed cities of reltge for the man-shayer not permit the avenging of blowd by the nearest kinsman but allow bim to receive money as a commutation for the murder. The Arsbs follow the primitive custom to this day. Hereditary feuds of clans, fanilies, and tribes have always origitated in the arenging of blood, of which the Tendetta of Corsica is the most modern and familiar example in Enrope.
Biood-bap'fism, $n$. (Eccl. Hist.) In the early Christan Church, when any one snffered aurtyrdom withont having been baptized, he was considered to have beea bloud-baptized: and hence martyrdom was termed blood-

Blot'tingly, adn. With blotting.
Rfot'ins-paper, $n$ Unsized Paper, serving to fmf its first use is known to exist, it was probathy intro duced soen after the invention of paper. Fuller (about 1655) says: "Paper participates in some surt of tho characters of the countrymen which make it: the Venetian being neat, subtile, and court-iike; the French. light, slight, and slender; the Dotch, thick, corpulent, and gross; not to say sometimes niso char biba, , ack ing up the ink with the sponginess thereor."
 Hie person and accomplishments attracted the notice of Queen Elizabeth, who conferred on him the honor of kaighthood; and some of our readers will remember the manner io which he is introduced anong the cunrtiers of that queenin Sir Walter Ncott's Kenilworth. In 1594 he was made Governor of Portanouth, and suc ceeded bis brother in the peerage, assembling some
tronps, with which he served in the Nethertands and in troops, with which he served in the Netherdands and in Brittany; hut the Queen wits displeased at his absence, and ordered him to return to court. She made him
Knight of the G.urter in 1597 , and gave him a military Kaight of the G.arter in 1597, and gave him a military in 1603 he returned to Ergland, bringing with him Tyrone, the rebel chieftain. Subsequantly James 1. er ated him Earl of Devonshice, and made him Master of the Orduance. Towards the close of his life he fell into disgrace by marrying the divorced Lady Rich, Bister of the unfortudate Essex. D. 1606.

IBficiciser, (blon'lr, ) Oenh ard Learecht von, (Fifin Marshal.) a distinguished Prussian gederal, whose imputuForwind" (Vorvilrts) wis the ajpuethation of $17+2$. II entered the Swedish service whan quite a youth, and it his first campaign was made prisoner by the Prussinu whom ho afterwards joined, and roee to the rank of captain; that bring discontented with the promotion of othor oflicers over his head, he olitained his dischark pitliy remark that "he might go to the devil if he pitlyy remark that "ho might go to the devil if bo ment. Buing recalled ly Kug Frederick William, he was mule nujur-gerural aftur the lattlo of Leystadt, in Fi:t, and commanded the cavalry at the battle of Jema, which decided, for a time, the fate of the Prassian monarchy When I'russia entered into the cosalition wosinat Napo leon, in 1813 , our hero, then seventy years old, was
made general of the centre of the allied army ; distinguished himself at Lïtzen and Leipzig, pursued the aying French ncross the Rhine, and after a year of obHonte conflict in France, headed the right wing of the poleon's abdication, in I814. In Eogland, which he visted with the allied sovereigns, he was received with enthusiasth. Being re-invested with the command of the Prussian army during the Hurdred Days, he was defeated by Napoleon at Ligny, on June 16, isi5, on which occasion he wat unhorsed and charged over by both the rench and Prussian cavalry. Marshal Grouchy was commissioned by Napoleon 10 pusti B.s retreat, and lington required. But having deceived Granchy by leaving a budy of his troops to mask the operation, he retrograded unmolested, by a skilful and dangerons flank moveurent; and his advanced division, under Bulow, arrived at waterloo at five oclock, just as the whole reserved ćite of the French army was advancing in dense colnmin to make their last desperate effort to break through the British squares. This fresh flank attack on the advancing column contriluted greatly to decide the victury, and Blucher artived in tere to participate in the pursuit. He was a rough aod fearless soldier; brave, foe to the enemies of his country. D. at his eatate in roe to the enemies of his country. D. at his estate in

caverts are ashy-brown, mottled with a dirker tint : reddish-white line passeb above the eyes: a brilliant sky blue covers the throat and half-way down the breate this is set off by a spot of the most dazzling white, the size of a pea, placed precisely over the larynx, which enlarging and diminishing suecessively by the move ment of this part when the hird sings, produces the mas beautiful effect. The litue passes into a hanck hanu, and the Intter intr a fine orange: the belly is thuck white; the thighs and sides are reddish ; and the quil
feathers dlark lrown. Some males lave wo little white feathers dark bruwn. Some males have two little whit
apots on the throat, and soeje even thrco: hut comen linve spots on the throat, and boere even throe: but roms have sune. The foud of the Bluebreast consists of fliss, the
 hue. The females, when young are of a $n$ grecnis tint on the sides of the throuts and when very old, they have the throat sometimes of a very bright hlue.

(2namily of $A$ frre clabtige the genera Bua nud Fython. Of all the reptile
 is leagth, and of a strengith so pronligions as to to nblo mula, hy envaloping them in their winde fold eriming
 and swallowing theme the thir leiseris. In this silh andouer jaw, throughout the whole leasth, at well as the palate bunes, are armed with pointed, recorved, nolid, und jemmanent tewth, formjog four tearly equal rown nowe, and tho below. Thry have the tymbunte tone or pedicle of the hower jaw
enovable, which is itself nlonest whelly segnectrded to Enovable, which is itself nlonest wholly sesperended to another bone, unalogons to the mastoid, and atherhed to
the skall by tanseles and liganamen, which contribute to its molvility. The lorancbesof this jaw are not noited, and It motrifty. The hrambes of this jaw are not hinited, and illary tone only by ligamante, ro that the intermax can dilate the mouth sutbiciently to cwallow bodiee wuch larger than themselves. They are further distinguiblud by having the scuta on the cther vart of the tail ningle a hook on each side of the vent; the tail prehensile; the borly compressed, and largest in the middle, and with sman scales, at lenst on the potserior part of the head Enormous as the size and power of such animals must be, according to the latest and liest authenticated statements of eyc-withesscs, yet, if we may rely on the ac pents far more terrific comnitited their hideons ravagas and kupt whole armica in dismay. Ope of this ravagi described ar luwiug hud its Inir on the butse of the Bagradas, near Eitica, and to hase swalluwed manyof the Itoman soldiers in the army of Regulan, to hare killed others in ite folds, and to have kept the army from the river; till at leugth, beiog invunarable by ordinary weaprots, it was destroyed by heavy stones alung from the military engines used in sieges; but, according to the historian livy (quoted lyy Valerius Maximus), the waters were polluted with its gore, and the air wath the steans rom ths corrupted earcass, to such a degree taking with them however the skin 1,0 fet in canp, which was sent to pume. That none of such frightfin drmensions nuw infest the inlubuted parts of the erith we have blumdant evidence ; and there is good reason to believe, that, as cultivation and jopulation have increused, the larger spccies of noxious animale have been ex pelied from the luauts of mankind, and driven int mare diatant and uncultivated regions. Sume apecies of the genus Bou are found in the vest marshes and suamjes of Guiama, aud other hot parte of the American continent; others are nutives of India, Africa, and the larger saperior size and thair beantiful preemineat from their titute of fungs and venom, nature has endumed then with a degree of ouscular power which neetes to defy resistince. The ground-colve of the whole animal, in the younger specituens, is a yellowish gray, and sometimes even a bright yellow, on which is disposed nlong the wholo length of the back a suried of large chairs liko reddish-otown varicgutions, leasiug large upen oval spacess of the ground-culor at regular intervals; the largest or princjpal marks composing the chain-like pittern uhore meathmed are of a syanrikh form, acom patied by lafge triangular and other shaped spots, the darkir cast, and the cround-color immediately next to them considerably lighter than on other parta, thus constitutiag a g.peral fichneser but pasily deecribed. We camot rifuct upon the history of these groat reptike the situatious in which they are cummonily unat abuthdant. In regiond bordering on great rivers, which numu-
ally inundite rant trat ke of conntry, theme serpenta 11 vo securely amonk the tress with which the soil is covered,
nud are capable of enduring very protrowted bunger,

a piece of beef. -In cggs boited aod roasted, . . . there is scarce any difference Boil, $n$. [Ger. beule; A. 8. bile, byl; Icel. bola, a bubble, a pustule.] (Mrd.) A tumor of the skin and tho adjacent paioful disuasc is profestionally called furumcutus. Tim swelliog, ot a deep red color from the begioniog, exceedingly painful, and almost atways terminatiog, alter tedious process, in suppuration. A boil geaerilly com mences with is samall red pimple, uncommonly temder nod angry-looking, which, after a time, entarges, haviag a wite point, hud hroad, whe alling the point or apex sinks till the whole assumes the form of a flat elevited cake with a puckered centra. Tha suppuration is always slow, and never perfect, for the discharge, or pus, is tinged or mixed with bluod and fibres of the cellular tissue.-Causes. Boils nearly always arise from constitutional canses, and are, in reality, effurts of natture to throw off, or relieve the body of, some impnrity, that, retained is the sybtem, would be prejudicial health; heoce they have been populariy called heaithy, as after them the system usually feels lighter and het-
ter. Boils gonerally ocenr iu Inll-bodied, free-living perter. Boils generally occar in full-bodied, free-livigg per-
sone, in robust health aod the prime of life, theugh they sons, in robust health aod the prime of hife, though they The parts most liable to boils are the neck, between the shoulders, the fleshy part of the urm and the liip, or spper part of the thiph, rendering the sitting posture apper part of the thigh, renderiog the siting posture in some disordered stata of the digestive organs; and hence it is necessary that the bowels be at first freely opened, aod then regulated by gentle unirritatiog Isxatives. The diet should be plain and simple, and stimulants ought to be avoided. In delicate coustititioos, a course of earsaparilla will be Iound of great use. In
dealiog with the boil itself, suppuration is to be hastdealiug with the boil itself, suppuration is to be hase ened and perfected by as the prominent part of the swelling beand as soon as the promineut part ba made into it with a lancet, and as much matter as can be pressed out of it by tolerably firm pressure slould be removed, together with the core; or the poultices should be continned notil the core is drawn out, when the wound will Boil'ary, a. (Salt Manuf.) A place in salt-works where Boileau-1bespréanx, (bwaw'lō-d $1-p r \theta-0^{\prime}$,) Nıcolas, a Frebch poet aud satirist, e, 1636. His fiather was oue of the registrars of the Parliament of Paris B. Was educated at the College d Harcourt (afterwards College Royal do st. Lonis), end early showena he studied law, to theolory, and obtained a beuefice, which be beld until his fither's death, from which event he derived a small independence, and thenceforward cave the reios to his poetic fancy. His earliest poetical attempts were in satire, by which he nulified a prediction made by his father, who, when comparing the genius of each of his threa bons, used to say, that as lor Colin, he wonld Dever speak ill of anybody." But the seven Sutires
which $B$. pubhished in 166ti, with a prelimiuary addrese which $B$. published in 1666 , with a prelimiunry acdrese to tho king (a formula not to be ornitted by any author who courted popular notice), wero phay mi and sportive, not re of himelf aither thor excited considerable attention among the lettered circles of the capital by a terseness of lagguage and a polish of versification to which the public ear liad not heretofore been accnstomed. Nevertheless, they evince intimate ac quaintaneo with his Romato predeceseors, and an accurate estimate of the demerits of his own coutemporaries rather than any vein of originality or any intrinsic poctical superiority. Tho number was iacreasell frem time to time till they amonnted to twelve. Of these, the tenth, on Wonsen, periaps cost most elahoration ; but
to 118 it aypeare to possess neither tho deep-marked in dignation with which the censor of Aquimm has lashed digntion wifis which the conbor of Agniry hace witl which the Hard of Twickenham has touched their toi bles. These were followed liy the Art of Pbetry, and in 1674, his Lutrin нppeared, - to our eapprehension, B.'s best work. Tho general ndmiratiou of his poems fed to his introduction at court, where ho read sume cantoe of the Lutrin to Louls XI V., who granted hith a penaion of 2,000 livres (uthut $\$ 500$ yer annum), and the rayal privilege to print his works. Ite wat at the sane tune appointal joint hiatorigkrapher with his

Boiled, (boild,) p, a. Dressed or cooked by boiling Boilere, $n$. A person who boils.

Mech.) A vessel in which water is boiled for the or conper, in which vatec is vaporized, and employed in the gaseuvs form watec is viporized, and employed in -ne gaseor other machines. In this case the effeet of the nachine redeor the water into wapor, and this power is the only one used. The B. must the eatisfy certain conditons which are of the higher in terest. Thus, as the motive power of the eugme de peods npou the excess of the pressure of the steam fihe B., it is necessary that the later stould be of sufficient strebgth to resistit; and as the heat apphe frewny hould be coustructed so as to eaplor the whole It The denger of allowing the $B$, to sink 80 low as tot the metal come in contact with cold water ad mitted suddenly, must also be carefnily guarded aganst, ad this necessity gives rise to many contrivancea of complicated nature. The parts of a B., ordinarily, are the furnace, consistiog of the firebar, the ash-pit. oud tha bridge; the B., propetly speaking, wit its ale chest, ant pipe, and its soffety-cultes, the apparatus tor ascertaiming the level of the water and its pressure in he B., which coneists in the shean-gaug, and ihe pressuregauge or munometer; the float and tubes, and and it reqnires a special adaptation to the class of cogine ander consideration; For the purposes of ordinary commerce, all be present in steam-engines, and mist be modified according to whether the B. is intended to work et high or tow pressure. Many varieties have been proposed is the manver of heating tha water contained in the $B$., and as the heat developed io the fornece acto more by the extent of the sarrate to which it is applied than by its intensity, every form has beeu recommended for this purpose in its turn; but, after all, it scemis that local considerations are of more weight is decting the kind of furmace thau any abstract ones, and the sthes. The principal forms of Tornaces are referred to in other parts of this work, and the same remark may be extended to the other details; becanse there ere no universal principles regulatiog theie constructiun, which would admit of being laid down enthoritatively. $B$. are knawn by names indicating shape, as : Cyindrical, Hay-stack, keuke, spherical, Wapon; or posion, as Horizontal, Purtable, Sthlionary, Upright, or Vertical; or use, as: Locomitive, Marine; or construction, as: Flue, Return-flue, Tubular, Water tube, Drop tube, NecSuperheaters. The principal canses of the too frequent Superheaters. The priscipal canses of the too frequent For heatiog water fer the porpose of warming buildings, the hoilers are rery Iregmently made of of cast-bire when the quantity of watce to be heated is small, or of wrought-iron when it is greater; the lister naterial is, however, so gencrally used that it is alone werthy of notice.
Botler-plate, $\boldsymbol{n}$. (Metal.) The description of wronght iron which is wronght expressly for the purpuse of boil-er-making, though by common orror it is made to apply to the plates which are used for ship-building, bridges, or girders; hill or which wre now in beiler-plates. The average the square inch, nud the is taken at about 20 tons on tho square inch, nan taken eafe wise the effect of riseting upon the structure is conefilered to be equivalent to a rednc tion of strengeth corresponding to pied by the rivets. The Board of Tramle, in England require that the strength of wronght-iron structure should lio it least equal to tho above quantity of 5 tons per squaro inch.
Boil'ery, $n$. (Salt Manuf.) See Bollary
Boil'lug, p, a, Bubliding; leaving io bubblea; being agitated: as, boiling lignor. - bressing or preparing for some purpese by lot whter.-Swelling wita heat, ardor, "r passion; as, of ont with raze.
Boll'lagly adn W゙ith boiling Sobilinu-joolut. $n$. (Chem.) A liqnid ls sald to hoil whenit ls made to nosme a constant atate of ehnilition by the formation of bubteles of its vapur ly mieans of heat. The hoiling-pointa of liquins dudur nccording to their chemical conktitution; in mawy invosition. Th beriling-point of the same liquld may vary under dif ferent circhmstancus: anch os the presmen on tes bur fisce, the ambunt of attraction is in solution. Bofling, of taining it, or by enits held lyy it in solution. In the formane The emin of atemind tinn of a vapor of equal chasticity ikuil, it therefore follows, that any leseoulng or it crrasing of the presure of the air ie accompanied by corremponding dequesslon or elesation of the bolling point. Thls fact is mate evtilent hy the familiar exper sent of plaring warm water under the receiver of nn iep-pump, when, on wxhasting the air, comilition trik flace, frum the timininhed proseste LIGuidk, in geberal heil from tio to $1+1^{\circ}$ lou er thint their ondinary loiling witut when hested in racme. This propaty is madie une of in the manntactire of certuin modicimal prejarntione, the pruprerten of whin wouni

this property of flaids in the measurement of heiphts which is nearly 3 miles atheve the level of the sent, Water point of watur to he $180^{\circ}$ Fubr. on Mount Jembiach while the barometer stand at 17 inches. From the facts it has beeo calculated that for every difieronce in height of 596 feet, at variation of 1 Fabr. in the beiling print is produced. It has also brou ascertained that Variation of one-tenth of an inch is the barometer pro duces a difference of more than a twontinth of a degred Ealir. in the boiling-puiat. The contrary property of increase of pressure causing elevatius of the boiling point, is evident from the above considerations. P'pius air-tight xeasel, it may be heated to a temperature only limited by the strength of the vessel. This propurty is taked advantage of in the preparation of geluture from boues, which ise heated to is temperature much biglier than 2120 Fabr. By this means the gehatine is eatsily separated from the parthy matter, aithough tho boucs migbt be boiled for hours nt $22^{20}$ Gular, without noy such effict takiug place. The attructivo of a fluid for the sur face of the vessel in which it is builed has a great influenct on the boiliog-poiat. Water boils at 212 ius metallic vessel, in a glass vessel at $21 f^{\circ}$, while in a vessel varoished ioside with shell-bic, the heat may we rased of ebullition takiog place. The influeace of salts held in out ebullition takiog place. The thated solution of chlorate of putash, $i$. e., coutaining $61 \cdot 5$ per cenc, of the salt, buils at $220^{\circ}$ Fahr.; a saturated solution of chloride of calcium, coatainibg 323 per ceat. of the salt, boils at $\$ 35$ Fahr.; while as aaturated solution of acetasto of putash. contaiaing 798 per cent. of the salt, buils at $330^{\circ}$ Ealar.
It will be seen from thuse examples that the quaetity It will be seen from these examples that the qumetit of salt contained is the liquid does not directly Kopp and
the boiliog-poiat. Froun the experiments of Kin others, it has been discovered that an cxat ratios ex ists between tatechemical coostitution of cortan fiquids methylic, ethylic, propylic, and butylic alcohols differ from each other by an increment of $\mathrm{C}_{0} 1 \mathrm{ll}_{3}$ and their boiling-points differ by an increment of $3 \hat{i}^{2} \cdot 4^{5}$ Fihr. An other exauple of this is shown in the bydrocartons benzule, toluele, xylole, and cumble, the differane in their composition beigg $\mathrm{C}_{1} 11_{2}$, white the diff-r-nce of
their boiling-points is $+1^{\circ}$ Fihr. The saen relation runs through the acids, ethers, aldehydes, and salts of these hodies. - See Erulintas

Induce the British calinet to assist the Independent
party againat the Royalists, and in the following yerr he was acting as governor uf Puerto Cabello, the strong-
est fortrese of Venezuela. He was now fairly committed to the revolutionary cause, serving aoder General Mirauda, whom he afterwarde accused as a traitor and who bnbsequestly died in a dungeon in Spain. The war continued to rage, and after many reverses snd changee, he gradually won his way to tbat goal for which he had hereically and disinterestedly fought. At length, in 1821 , the iadependeat trorps were snccessfnl in the battle of Carabubo, where the Boyaliste lest npwards of 6,000 men, and which decided the cause againet Spain. On the 20th of August of the same year a republican constitation was Adopted, and decreed to continue, as and be turned his attention to the interoal admioistration of the conetry. In 18.23 be assisted the Peruviuns to obtain their independence, and was declared their liberator, sad jovested with supreoue authority. On the loth of Fehruary, 1825, however, he convoked a congress, and resigned his dictatorship in the following words: "I felicitate Pern on being delivered from two things which, of all others on earth, are most dreadfu]
-war, by the victory of Ayacncho, and despotism, by War, by the victory of A yacncho, and despotism, by this my resignatiun" He How visited the upper pro-
vinces of Pera, which, calling a convention at Chnquivinces of Pera, which, calling a convention at Chnqui-
saca, gave the natme of Bulivia to their country, in saca, gave the natme of Bulivia to their country, in
honar of their liberator, and appoioted bim perpetaal protector, acol to draw up a constitntion. On the 25 th of May. 1826 , he presented his Belivian code to the congress of Bolivia, which was afterwarde adopted, with some dissatisfaction, Lowever, although it was also subsequently ndopted by the coagress of Lima, where, ander its provisions, he himself was elected president for life. He now bet out for Colombia, where disaffection and party strife were at their height. Hie cooduct here Was misconatrued, snd he was supposed to he assuming
the powers of a dictator. These suspicions beem to the powers of a dictator. These suspicions seem to
have deeply affected him, for he wrute to the senate, have deeply affeeted him, for he wrute to the senate,
ia February, 1827: "Suspicions of tyrannons nsurpation rest upon my name, and distnri the hearts of Colomblane. I desire to be arade only a private citizen." In 1829 new disturbances arose, and, io 1830, a constitution for Colombia. The proeeedings were begui by Bolivar, who onee more tendered his resignation. Ile was pressed to retain his position; but his resolutioo was already formed, and he bade adien to publie life, broken in mind aod hody. He retired to Carthagena, wheoce, in 1831 , he eent an address to the Colomlians, vindicating his conduct, aed eouplaining of their ingratitude. Thie wae his last act which had relation to pnblic affinirs; for by the end of another week he

## FaExeh.

B., LUTEPY, Pance de Casivo and Muhtimano, the third son of Charles and letizia Bmaparte, was is at Ajaccio, in 1775. He womigrated to Marseille with the rest of the family, in $1 i 98$, 11 e entered warmly into tho revolutionary notions of the period, made npeechen
and wrute paniphlets on liberty and equality. Sonn and wrote paniphlets on liberty amil equality. sonin
after ho oitained employment in tho commikearlat at St. Mnximin, a emill towno of Provenco, where he matried the danghter of an innkerper. Being one of the re publican manicipality of that place, lie exurted himelf landabily, apd ut his awn imminenis juril, to save several untorfumate itulividnuls arrused of royalism, whom an agent of Barrus und Fieron, the terrorist commisnionera in the sunth of France, wanted to remowe to the prisons of Orange, where the cuillotine was in constant activity. By shawing a bold tront to the agrant, whom Lacfen charged with informulity in lis comminkion, he detained the intended victima umber arrew at st. Maxi-
min, antil the fall of Nohespierre put a ston to the reign min, until the fall of lohespierre put a stop to the reign
of turrur. In the renction, however, which touk place In the sonth of France, Lacien was arrentent as a Jacobin, on accomut of his npereches; and a royaliat, whom the hal saved, proved must hostilo agatinst fim. He was, however, limerated after a time. In 1 IStG, latiom was ajppointed commissary at war, probalily throogh the influence of his brother, General $B$. In the following yenr he was elected Deputy to the Conncil of the Five. IInmdred, and he went to reside at l'aris, where he took in house, of which his sister, Eliza Bacchiochi, did the hon-
ora. Ilis drawing-room was resorted to loy several nen ors. Ilis drawing-room was resorted to ley several men of note Knd hiterary nequirements. Gltien tow the opposition sure in the conncil, and allied lamself to Sieyes and his party, who wished to tiy their hands at a nu-w wroto to him, complaining of the incupuriy , hat mis government of the Execntive Darectory, und urging him to retirn to Frauce but the letters are caill to luwe lewn intercepted by the Euglinlt cruiners. Atter Naspoleon's return, in 1799, Lacien, who wes the prosident of the conncil, became the a-tive leader of those who winhed to overturn the Directory. In the sturmy nitting of the 19th Bramairo (see Napoleav 1.) Ine rosisted the motion made by several members to ontlaw Gencral $B$., and an
the confusioo and pproar inervased in the hall, he left the contusion and oproat incrused in the hall, he left
the chatir, and suldreseing his brother's soldicos outside told them to march ing, and drive away the factions men who were no longer the representatives of France After the accomplishment of that revolution, in whwh he rendered most material aksistance to his lirother, he was one of the members of the commission which framed the new or Consular constitution. Soon after he whe appointed minister of the interior, bet remained in office his brother opon matters of edminiatration ; pad, In October, 1800 , sfter the campaign of \$arengo, Napoleo sent him anobsatuor to anin. his mizsion proved suc cessfol; he mavaged to ingratiate himkelf with Charles infucnco in Savonte Godoy, and to re-estalitish French intucaco in spair foren in an raich endud hy the latter conntry beiny oluliged to and for neuce, for which it paid dearly He also completed the arrangements concerning the new kingdom of tiru ria, to be given to the young Infanta, son of the Dnke of l'arma, who had marriod a Spmish princeave Dak change for whicb Spain ceded to Frunce her rights upou Parbil and Piacenza. The cession of Lomisinna to France was likewise confirmed. Having concludel thed negotiations, Lucien rethrned to Paris io 1h()2. Ho was made a member of the Tribunate, and as such he supported with all his eloqnence, the concordat with the bucien wa modo senutur and his lrother ore him the ernatorship or liviuce of Sopeladurf all eature hir former elector of Trever, His wife haing dead. Hucien married, in Iso3, Madnme Jonberthon, the wife of atockbroker, who hotl died at st. brmingo. Napoleon disapproved of this marriage, as he had dimapproved of the marriage of Jerome, because he looked torward to royal nilliances for his brothers. Lucien, however, supported the project of making his brother consul for life but he eays in hia memoira that he winhed to have etopped there, and that he opposed from the firat the idea of ewtablishing an horeditary dynasty. When he saw he left France in the apring of 1804 , ind went to ftaly, he left France in the spring of 1804, nud went to Italy cession in Napolvon'a family, named thia brothers Joseph and Louis us reventual heirs to the throne, bot made no mention of vither Lumien or Jerorac. Lucien, after it time, fixed his residance nt Rome, where he was very hindly received by Vope Pins V11. Being fond of litera ture and the fioe nrts, his honse was much frequented.
After the peace of Titeit, Napoleon repaired to N. Italy
at the end of 1807 , and seat to his brother Lncien to meet bimat Mantua. The two brothers had there a cooference, is which it seerus that Napoleou offered to give
Lucien a kingdom in Italy. at the same time telling him plainty that is such case he must le prepared to olvey all his orders conctraing the internal as well ae the ex-
terual policy of his administration. Lacien declined accepting a crown on these terma, and said that he accepting a crown on these terma, and said that he
preferred to remain in a private station. "Be it bo," preferred to remuin in a private statina. "Be it so, ground of cotmplaint agaiust me." Locien returned to
lome. Pope Pias VII, createll him Prince of Caninu and Musignano in 1808. Sooo after, Napoleon began a course of vexatious proceedings towards the conrt of
Rome, which ended in the arrest of the Pope, and tho Rome, which ended in the arrest of the Pope, and the
geizure of his doniaions. When the French took posseizure of his dominions. When the french took posself very freely againat thas part of his brother's policy Was alvised to leave that city, and he retired to Wie Statee. With this view he embarked oa board a vessel st Civits Vecchia, but was seized by an English crniser, and carried to Malta, where, after a time, he obthiaed permasion from the British government to reside in upon as his residence. Soma time after, he rumuved to a place in the neighborhoad, whare he remincll till the
end of the war, and employed himself in writug hie poem of Charkmagne. After ibe peace of islthe returned to Rome. When Nappleon returged tu France
frota Ella, ia lsis, Lucien rupired to Paris for the purFrom Ella, in 1815, Lucien rrpaired to Paris for the pur-
pose, as is said, of obtaining his brother's favor towards pose, as is said, of obtaining his brother e favor towarde
the lope. It hat been furmised by gome that Lucien acted from a generous impulse, to teader to his brother his anvice is the hour of danger, and to keep hitu algo,
ir possible, within constitntional limits. However this maty be, he went to live at the Palias Royal, absuand the style of an Imperiat prince, and in the privy conncils that took place, he alvised Nitpoleon to officr to the Emperor of Austria, in order to detach him from the
allies, to abdicate in favor of lies son. Ifis advice, after allies, to abdicate in favor of his son. Ifis advice, after
some hesitation, was rejected. Napoleon set off for the some hesitation, was rejectet. Napoleon set off for the
army, lost the battle of Waterloo, and returned to Paris army, lost the battle of Waterloo, and returned to Paris
withontanarmy. Lucien, being appointed extraordinary withont an army. Lucien, being appointed extraordinary representatives of the people, struve to revive in the representatives of the people, struve to revive in the ther; he spoko eloquently, he appealed to the grastitude of the natiou, but was answered sternly by Lat Fayette, of battle, from the burning sabile of bigypt to the frozen deserts of Russia, through dinasters as well as trinmplos, and it is for this that we moura the luss of three millione
of Frenchmen!" Lncien ulvised his brother to dissolve of Frenchmen!" Lncien ulvised his brother to dissolve
the chamber, since be could not manage them, and to the chamber, since be could not manage them, and to
asmue the dictatorship. Nipoleon hesitated, sad ut assume the dictatorship. Napoleon hesitated, sind wat
last refured; hesain that he wonld not kindle a civil war. 110 most likely perceivel what laneien did not ace, that gle, attended by additional calamities to framco and to gle, attetrded by additional calanities to franco and to abdication; but when lie saw his brother deturmined upon it, he iosisted upon tis heing made at least in favor of young Napoleou. Napoleon amiled and slouk his hand incrednlonsly, but at longth inserted the clanse in fayor of his soo. Lacien titen proceeded to uddress the Inose of Peers, to iaduce them to proclam at once
Napoleon II., but is vain. Altur the entry of the allied Napoleon IL, but is vain. Altur the entry of the allied

(Law.) A deed whereby the obligot or party biadiag blmself, obliges himself, his heirs, exectors, and ndmidistrators, to puy a certuin enm of maney, called the penalty, to another (the obligee). at a diy appointed. There is a conditioa added, that if the obligor does some particular act, the obligation shall be vold, or else ri formed, the bond becomes forfeited or absolute at law, and charges the obligor while living, and after his death the obligation desceuds on the their, who (in default of persomil assets in the haods of the executor or administrator) is bonnd to discharge it, provided he has real assets by descent. The condition is usually (although not necessarily) iacluded ia the same deed, and at the foot of the bbligation.- The boad withont is condition is termed single (or simplex obfigatio), and becames single by forfeiture, on non-performaze whole penalty mentioned in the bond was relaw, the whole penalty mentioned in the bond was re-
coverable on snch eon-performance. But by the interposition of equity, the ebligee was discharged from pasiug more than the sum to which the obligor was reasonably eatitled; viz,, his principal, interest, nud expenses, if the boud was for pryment of a debt; or the dameges accroing to him, if it was for the performance of a etipulated act. But by 4 and 5 Anne c. 16 , it was eaacted that in case of a boud conditioned for paymeat of money, the payment of the snm dne, with interest and costs, even though the bond be forfeited and suit commenced thereoa, slath be a full satisfaction and dis bond on which aeither principal mor interest has bee demanded for twenty years will be presmaed to have been satisfied; but leagth of time is not, strictly, a legal bar, but enly a gronud for the jury to presnme satisfac tioa. In a bond where several are bound severally, the obligee may, at his election, sue all the obligor together, or each of them apart, and have several jnd ments and execntions: bnt he shall have satisfaction bi once; for if it be by one oaly, that is sufficient to dis-

the tranknission of bloodvessela into tho
interior. Thes cauals, in the long $B$., runfor the most part
 in a dirretinn Fig.384.-TRANSvense section op nonz parallel to the (Sbowing tes microscoplo stroetare.) central cavity,
and communicato with this, with the external surface no with each other, by frequent trausverse brancheIa the loag B. of man and of most mammalia there ia a central eavity, which is billed with the fatty sobntance khown as marrow; and the space ia which the brarrow licy is call in the in it early tate hat is tirmad by tho exist ia the B. in its early etate, hat is furmaxi by the
removal of the cancellated osscons tisene fint developed in its interior. Among birds however, the centril cay ity, instead of being occupied by marrow, io filled with air, and commanicatee with the luags ; so that the metnbrake lining it becomes an auxiliary organ of respirition: while the lightenisg of the bones thus produced diminishes their epecific gravity. $\boldsymbol{B}$. are covered exter bally by a strong furous meanornme termed the perios teum, which Arrves to protect the blood-vessels enteriag them. The mednllary canal is also lined by an extremely which supporto the marrow, and provides a stratum for the sublivisions of the suedullary artery lefora they phe subdivisions of the nedulary artery vefora they pessess little senelbility in bealth, yet, when diseased, they become highly sunsitive, a manffest indication that they are snpplied with nerves. These may, isileed, be traced into some of the minute foramina on the shaft of a loag bone, but mure easily into the articnlar ends. A aerve aloo caterd the mednnay catul whi the wntrieat artery of the medulla, und divides, like the artery into an ascending and a descendiog brauch. B. is com"posed of a basis of animal matter, impregnated with dient makes it teuscions and elastic; the fecont ingredient mases it teuncions and elastic; the second givee
it the requisite hardneks. These may be eparated from each ethur: tho fatter may be entirely dinsolviad away, each other: tho latter may be entirely dinsolved awsy,
by soaking the bone in dilute zitric acid, when a anb stance of cartilagiaons appearance io left; the former by subjecting the $B$. to a heat sufficient to decompose the animal matter, whes weobtain the whels calcareone substance in situ. The suimal portion of a bone forzae about one-third, the earthy abont two-thirde; and the relative proportion of the two elcmeats is said to differ little in different classes of animais. It is not yet a settied point whether the proportions vary at of life; but the general opiniva is that they do, periods of life; but the general opinioa is that they do, earthy in old nge. B., when iried at $212^{\circ}$ until they earthy in old nege. Bo, when welght, consist of onethird assein, or organic matter, and two-thirds of phosphate and carbonate of lime and phosphato of magnesia. Ossein, when boiled in water, kradually discolves, leaving a small quantity of fatty and rascular matter flating on the solntion, which, on cooling, gelntinizes, forming a weak glne or size, cousisting of nearly pure gelatine. The carthy matter anay be reparated from the ossein, either by
meater of an acid, or else by builing in water in a l'spin's aneane of an acid, or else by builing in water in a 1 spin
digester, at a temperature over 3040 , the gelatiae theing digester, at a temperature over 304 , the gelatiae being of $B$. are used as manure, and in the mancfacture of

(Hist) B. is the general name of almost every literary composition, but in a nore limited rense it in appuited unly to ench compositions as nre large enough to torm a yolamb. Short and fugitive pitces are denominated pamlength, and embrace more general or permanent topfes. The dimensions of printed buoks are rugulated by the size and form of the sheets of puper of which thry are composed. A sheet, lieing folded in the middle, forma two leaves, or furer pages; and a book of this size is make four leaves, or uight pages, it turms a puarto. The quarto, being foldell acrass, no as to make eight lemses, or sixteea pages, formis an oclovo. By folding the shed into twelve leares, or twenty-four pages, we make a daodecimo; and if into eighteen leasees, or thirty-six pages, we foran an octodeczano. Below this thero aro times spoken of as Pacht-ditions, Booksellens accustumed, in speech, to anglicize the turme for the size of books, with little reyard to the proper termina-tions- ns to. $8 \mathrm{mo}, 12 \mathrm{mo}, 1 \mathrm{mmo}, 24 \mathrm{mo}, 32 \mathrm{mo}, 4 \mathrm{hmo}$ \& c For a long period, printing-paper was made chiefly of three sizer, respectively called royal, demy, and crown; and according as nny one of these was employed, the size of the book was large or small. As by moans of the paper-making machine, paper is made io wels, and can be cut into every imaginable size of sheet, and as printing-machines can print very large surfacas, the for convenience, the old names remain, with the diffet ence, that in addition to the 12 monain, with the differ size, called the patt-8no, has come extensively into nee The size of the present work is falio, though printed an quarto. - The materials of which $B$. huve bern eomposml have differed much in different natians, and in different stages of civilization. Plates of lead and copper, bricks, stone, and wood were anciently employed for the phirphase The mokt common material un which $B$, were written hy
the Greeks and Romans, was the thin coat or rind (hber, the Greeks and Romans, was the thin coat or rimd (hiber,
whence the Latid name for a book) of the pspyrus, called whence the Latid name for a book) of the pspyrus, called book, biblion. Next to the papyrus, parchment wus the substance mast ased for writing upon. The ancients wroto nsually on unly one side of the paper or parchment. The back of the paper, instend of being writtur upon, was usually stained with saffrun color or the crdrus, which prodnced a yellow color. - As puper and jarchment were dear, it was frequently the cnstom to erase or wash out writing of little importance, nad to write ppon paper or parchmont again, which w.ts then called Palingsestus. - The paper ur parchment was joined to-
gether fo as to form one sheet, and when the work was gether 80 as to form one sheet, and when the work was
finished, it was rolled on a slaff, whence it wis called a finished, it was rolled on a staff, whence it was called wolumen. (See Fig. 230.) When ni author drided work into ancupal honks, it was nsual to include onl One bonk ina vulume or roll, so that there was generally
the same number of volumes as of books. - In the papyri rolls fonbl at llerculanconm, thestick on which the papyris 18 rolled does not project from the papyris. but Concented by it Uusuly, however, thero wrere balle or bosses, ornamented or painted, called umbilica or
cornua, which were fastened at each end of the stick, and projected frum the papyrus. The ends of the roll were
carefully cut, polished with pamice-stone, and colored carefully cut, polished with pumice-stone, and colored
black: they were called the gemine frontes. - To problack. they were called the gemine frontes. - To pro-
tect the roll from injury, it was frequently put in a parchment case, which was stained with a pnrple color, or Ages, the plan of rolls was discontinued, and the form Ages, the plan of rolls was discontinued, and the form
of leaves, sewed or bound together, came into use. The manufacture of books was, for the most part, in the hands of the different ordera of monks, many of whom spent a great part of their lives in the transcribing of
them. In the earliest period of the Middle Ages, the scarcity of books was so great, that often io a whole town there was not one to be found, and even rich mouasteries possessed little more than a miesal. To the monks, and also to some orders of nnns, belongs the unspeakable merit of having not onty supplied the religious orders with the books which were in daily use, and wealthy, until their ingenions craft was supplanted by that of the printer and bookseller. Copies were multiplied with rapidity and diminishing cost : nevertheleas,

Fig. 386.
early history discloses how much importance was conferred by their possessinn, and what solicitude was awakened for their care. The aceompanying figure, taken formerly adopted by echolars and monks for carrying and securing books: also, a singular heart-shaped kind of lmok, not without a certitin utility and portability to itd reader. In progress of time, as civilization and the arta became more developed, paper attained an improved quality, both as regards quality and strength; types, also, became amaller in form and finer in execution, and the hage mammothe of folios and quartos were deposed in favor of octavos and duodecimos. The art of book production has since consturtiy aimed at tionate limit of cost, while paying due regard to the conatenience and comfort of readers, and also maintaining that inclination towards the mnique and the beautiful, which, no doult, will one day be ultimately reached and generally diffused. The first $B$. issued in what were to be the future U. States, and, indeed, on the continent of North America, was the Bay Psalmunok, ln 1640, from the press of the " 4 Pilgrim Fathers," at Cambridge. Mass. Wiltiam Bradford issned an almanac from his press, in Philadelphia, in 1665, which was 3ook. v. a. To enter, write, or register in a boo

The art of $B 3$. $B$, exclualve of eaped work, may bo Tivided into two clusselus : 1. Fin lepther work, may extra B., in which matual hamir and pormond akill are chiefly amployod; margaty executed by the atd ot machinery. We will
firet notice the operations through which a hook passes in ordinary $B$. These are grouped under two main
dirisions-" forwarding," winch comprehends every-divisions-" forwarding," which comprehends every-
thing necessary to the folding of the sheet, and "finiththing necessary to the folding of the sheet, and "finith-
ing," which concerns chielly the embellishment.-For-

Fig. 387. - cover of missal of the 15 th ceattiex. namel, ivory, and precious stone
warding. The sheets of a book are first folded in euch a manner that the pages follow each other in consecutive order. In this operation the fulder is guided hy the "signatures" (q.v.), which indicate the part of a eheet to be superimposed upon another. The labor is performed by folding-machines or hy girls, who acquire incredible dexterity by continued practice. The mext operation has for its object to bring the loose and bulky eheets into a compact form, which was formerly accom plished by beating them with a broad-faced hammer upon a smooth, hit stone, Lut is now gederally made by passing the sheets letween the cylinders of a in "sections" composing a volume. The volumes are then adjusted and clamped up in the luying or cutting press, for the operation of sawing the buck, preparatory to sewing. The sewing is done at a well known apparatus called the eewing-press or frame. which, howerer, is now, to a great extent, supersedel by a book-sewing machine of American invention, which effects an average saving of one-half the cost of hand sewing, and is simple and perfect in its operation. When taken out of the sewing-frame or machine, the tly-leavea are pasted on, and the hack is covered with in eoating of thin glue. When the glve is dry the back is rounded by beating with a hammer, and then the volume io the tacks alichtly project-edged bonrds, above which the backs blightly project. is, the back of the book is well beaten pntil it projecta a little over each side of the bevelled hoard, so as to form a groove or place for the mileboard covers to lie in. The book is now ready for the boarding. The hoards are attached by the ends of the bands, left for that purpose, being passed through holes in the sides of the boarde. The ends of the hande are then pasted down, and hammered flat and smooth. The volume is now put into the standing press, where it is sulmitted to a powerfal preesure for several hours. Thereafter it is agnio fastened into a lying-press, for cutting or ploughing the edges with a knife edged instrument the cutting of the edges is previonsly done hy a large machine-cutting knife.
Hook'-case, $n$. An article of furniture; a case contarning whelves for holding and preserving books.
Book-debt. A duht recorded in in trader's books, as

 of murchusts. tralera purnulta connected with money. it has not only the
anthority of experience to recommend it, but that of some of the wisest observers of human affairs. Dr. sccomplished merchsnt is a school of methed of an the great science may be learned of rancing particulere under generala, of bringing the different parts of a transaction together, and of showing at one view a long series of dealing and exchange. Let no man (he adds, vontore into large business while he is ignorant of the metbod of regulating books: never let him imagine that any degree of natural ehilities will enable him to supply this deficiency, or preserve a multiplicity of affairs trom inextricable confusion." Thereare two modes of keeping books of account: the one by what is termed Single, and the other by Double Entry. Bothare in very general use. business of retail deslers: it is much the coniplest to the of $B .-K$., consistiug of only a $D$ oy-book, and a Lediger In the day-book the dealer enters hissales und purchaser and in his ledger he carries the former to the debit of his customere, and the latter to the credit of the merchants who eupply him with goods. By making at eny time a list of the sums due to him hy his castomers and of those due by him to wholesale merchants, the retail dealer may, after adding to the delits due to him the valne of his stock on hand, arrive at an approximation to the real state of his debte and assets. This, however, is but an imperfect asid nnsatinfactory mode of $B$.; and, therefore, in the case of wholeasie and mercantile husito be recorded, recourse is had to the system of double entry. This eysteta possesses all the adrantsges of siugle entry. Tesseystem possesses all the adrantsges of singleits principlee, and socertain in its results, as to admit of nuiveraal application. It misy with equal advantuge be adopted in the most limited as well as in the moot extensive, in the most plain and eimple as well as in the most intricate and complicated concerns. No very eu-
thentic accounts exist of the origin of $B$. The donblethentic accounts exist of the origin of $B$. The donbleentry kystem appears to have been first practised towards
the latter part of the 15 th century, in Yenice and other tile world; and from that circumstence it acquired the nume of the Ilalion method of Bunt-hceping The first nume of the flation method of Bonf-kceping. The first lished in 1495: and the first in the Enclish language, treatise hy John Gough, a printer, published in Lundon, in 1543 . The advantiges of the system, and the sonnd ness of the principles on which it is based, soon became apparent; for we find it was adopted in Eugland and France early in the 16th century, and has continued to be more and niore practised down to the present day. The great oljects of a good method of B. are to exhibit transactions as they occur, in the mont minute detail, and ultimately in the most condensed form; advancing locid steps as at all times to admit of such clear and traced in its progress, and security being olbetined at every etep agninst omission or errur. Fur the nttain ment of such important objects, no mode of $b$. has hitherto been devised at all appraaching to the perfaction of the Italian system hy dumble entry. Every transaction in business is twofold: there can be no receipt without a payment, and no purchase without a sole, and conse quently by presenting the same event or fact on both sides of the books, (whence the name of "double-cntry;") the entries being simultaneons, lecome corroborative of each other. The circumstance of every tramaction being most valuable realts derived from the eystem of donte most valuable reams derivedrom. The nystem of donibe encry, namely, a test of sccuracy, (hasmnch as the en the delit side, otherwise the kook will not balance. The three principal books required under the 1taliun systum of doulle-entry are, a Oush-book; Jownal, nud Ledjer. Ia the first of these, every transaction is recorded where money forms one of its elemente, and in practice these transactions are ly sonto hook-keepens carried direct from the cash-book to the ledger withont being passed through the journal at all. The journal, however, forms a most important part of the system. It exhihits a narof money does not furm one of the elenuents, arranelng of money does not form al condeneed a form arranging nesk and intelligilility will ulnit of, and the romulte of those entries in the journal ars afterwards introluced into the ledger, whicli thereby liewomes a sort of key to the detniled history of every transurtion: while at the samo time it furnishes a lominous cumpendinos of the whole. In like manner, when the cosh thatisartiona are pasaced throngh the jourmal, they are at athed prorionde classed and arranged in a conulensed form, and thene transferrest to the ledger. This plan of introducing the cash transactions into the journal is conainlered much the lirst systoln, though attendeal with a little more troulife

linrity of the $B$. $T$ in the United states is the holding of linrity of the $B$.T iu the U Eited states, is the holding of
trade sales, or semi-amnual iuctions in one of the town trade sales, or semi-gmual nuctions, in one of the towns
above quoted, lut chielly in New York, to which puh lishers contribute, and which are attended by $B$. dealera These sales have been in suceessful operation for abou 35 years, disposing annually of hooks to the amoudt of sales do not appear to be attended wilh the same regularity as formerly, by many of our leading pullishers The terms of the agreement entered into between a publisher nod an athor are varimas, depending chiefly upon the character of the author and the mature of the book. Authors are apt tuc complaio of the hard terms that are usuelly meted ont to them ly publishers, and in some cases, perhaps, not without reason. But it is to
be borne in mind that there is al ways cousiderable outlay, and no little risk, conpected with bringing out a new book, especially by an unknowa nuthor. Cheap publications are now the order of the day. Not only copyright, but even publishers of the first class find it their interest to bring unt clueap elitions of popular therin interest turing uat chuap etitions of popmitr
books, the copyright of whech is secured to then. It $i \theta$ now ussal to stereotype cheap books sud periodicnls, of which the sale is expected to be considerable, or to ex tend over a considerable time : and this course is adopted even with large books like the present work. The old
book-trade, or the sale of second-hand buoks, is carried on to a considerable extent in all the larger cities and towns of the U. States. Many of these dealers prepare periodically price catalogues of their books, which they circulate throngh the conntry, and in this way dispose of a great many of their books. The price of old bouks io very fuctias their condition or intrinsic value; but frequently equally guod copies of the sime work may be had at a half or third of the price in some shops, thint they caa be obtained for in others. In Gernany, the great centre of the book-trade is Leipziy, where two chaelmas respectively. These fairy. at not 50 important, or so largely attended now ha formerly, a kreat part of the business being effected by means of agents or commissioners. Every book-seller in Germany has his cumnissioner at Lefipzig, to whom he transpoits copies of all his new publications, add who distributes them atuong the other commissionens, for transmissiun to their employers. At the end of the year the unsold
works are sent back by the same means to their geveral publishers. The great alvantage of this system is, that publishers. The great ainantage or th of system is, that made known throughout Germany and France, without having recuurse to the expensive system of afsertising. The accounts of the varions book-sellers are also usnally settled by means of the commi-aiiners. In Eng-
land und in France, the B. T. is carriet wo much in the land and in Frapee, the $B$. T. is carriet uo much in the snme way, centring respectively in Loulon and Paris.The first A merican bouk-seller, mentionell by Thomas in

soracie Acidl, (bo-rüsto.) (From Ar. banтac.sspecies of nitre. (chem.) This nctu, which may be regarded as teroxide of boron, is the only known cumpmand of uxygen and boron. It is obtained in a free state from the volcanic districte in the N. of Italy, where it isares from the earth ia the form of vapor, accomphicdey violst jets of steam, which aro known in the neighthorluod as shtheni or fumeroles. The evpors (B, Fig. 390), under shallow leaden evaporating pans ( , Fng. the flues (A) constracted for that purpose. Daring the

Fig. 390. - boracic lagoon, and eyaporatina pass. evaporation, great quantities of smlphate of lime are deAbout 750 tons of crude $B$. acid are annually exported from Tuscany. The crude acil is contamimated with 25 per cent.uf snlphate of ammonia and alumina, and other saline impuritics. B.acid is used principally for making borax, or bilurate of sondn. $B$, arill is formed in the laborntury ley lissolving purifted horsx in four parte of boil ing water, and adding to the hot solntion a quatity of sulphuric acid. eqnalingen out in pearly suales, con cooling, $l 3$. ncid crystallizes ont in pearly seales, contain 4 sbunll quantity of sulphuric acill, from which thry are freed by washing, dry ing, nud fusing them in a plaparts of water, and re-crystallizing, it is obtained per
fectly pure. B. acid, on being strongly heated, becomes auhydrout; and at a red heat it fuses into a transparent glass, which remains clear as it cools. It soon crambles to pieces by absorbing water from the air. B.acid comhence the use of many borates, more especially the bihence the use of many borates, more espechally the bi-
borate of sodi, as flaxes. It diesolves in three times its weight of boiling water, lut is very insuluble in cold. The solntion ia remarkable for possessing the properties of an alkali when tested with turmeric puper, which it changes to a deep brown. Even to litmus it only gives a slight reddish-purple tinge. When a solutiou of $B$. acid is evaporated, a certain quantity of the acid rises with the steam; and this is the cause of the fumerolles described above as existing iu Tuscany. Anhydrous $B$. acid is but slowly volatilized by heat. It enters into combiation with aliatine hased in several proportions, ulard. A sexborate and triturate of potash have beea obtained; axd although one contains six equivalents of acid and the other three, they possess the property of restoring the color of reddened litinus like ap alkali. B. acid dissolves io alcohol, and burus with a characteristic green flame, with the exception of biborate of soda. The borates are not very important salts, and need not be alluded to here, further thas to mention that, is a rule,
alkaline burates are freely soluble, while those of the alkaline borates are freely suluble, while those of the
other bases are either insoluble or very sparingly to. other base

Bora'go, $n$. [Lat., from bor, for cor, the heart, and ago, (Bot.) A genus of plants, order Boruginacea. The species $B$. nfficonulin, commouly kDown as Borage, native of Asia Minor, but naturalized is many parts of Europe, is with us a common inhabitant of the garden. It is
characterized by a wheel-shaped corolla with a very characterized by a wheel-shaped corolla with siles; by five stamens with forked flaments, the inner arms of which support the anthers; and by these anthers being connivent around the style, in the form of a cone. The eutire plant is rough with hairs, and has rather a coarse appearance; but its flowers ure very beantiful, being of ways added to a cool tansurd, or draught made of wine or cider, with water, lemen, and sugar. The flowers are used on the contident of Europe to orbabsent salads, aod the teoder tops are sometimes boiled in soups.

## Bor amelz, n. (Bal.) see Cibotum

Boras'wus, n. [Gr. borassos, the skin of the date.] (Bot.) A geous of trees, urder Palmacea. It cunsists of hat one species, which is found in every part of India. This has to the European inhabitants as the Palmyra. Its stem attaiun a height of from 25 to 40 feet, and bears opon its summit a maguificent coronal of fan-shaped政, when very be eaten. From the juice obtained from this plawt be earge quantities of an intoxicating driok are prepared by the natives. The fibres of the leaves are used for See Tuddy.
Bo'rate, $n$. (Chem.) A salt resnlting from the combina30'rax, $n$. [Lat., from Ar. baurai, baurach, a species of nitre.] (Chem.) A conporsad couturigg boracic acid and soda. It was formerly imported from the East in the crude etate, under the name of fincal, which cona saponaceous nature. It was parified by being heated with lime or soda, until the whole of the soapy matter With lime or soda, until the whole of the boapy matker
and other impurities were separated.
B is now mostly prepared by fusing two parts of boracic acid, obtained from the Tuscad latgoons, (see Boracic Acid,) with one part of sollansh. The mixture is thrown on the floor of a reverberatory furbace, and beated until all effervescence his ceused. The fused mass is lixiviatedand boiled until the impuritice are precipitated; it is then decanted and set uside to crystallize slowly. It crystallizes in rectangular hexagodal prisms, cootaining 10 equivalents of water. A new source of $B$. has lately beed discovered in California, in a amall sheet of water called morax by Mr Accordiagh ans made by Mr. A. Philips, B. occurs in the form of crysbottom of the lake. Besides the $B$. thits existing in a crystallized form, the mud itself is highly charged with that salt, and, according to an analysie of Prof. Oxland, when dried, affords $17-i 3$ per cent. of $B$. in them, in the portions of the lake now worked. $B$. is of great use in the arts ns a flux. flaving the property, wheo melted, of dissolving metallic oxide, it is used in soldering to clean away the film of oxide that would otherwise prevent the metals from uniting. It is sprinkled on the metallic surface, and melts with the solder. It is also used in Kold and silver refling, and in making ebamel, to ren-
der the compound more fusible. It is exteneively enployed in the manufacture of certais kinds of elass ployed in the mannfacture of certain kinds of glass, atud for fixing colors on porcelsin and stone-ware. To
the chemist it is very valuable io blow-pipe analysis. Porm. NaO.2BO ${ }_{3}$. Valuahle antiseptic properties have recently been claimed tior B. and Boracic Acta. (q.v.) Burbore'ma, a mountain-chain of Brazil, bounding the prov, of Ceara od the 8 .

A brief notice of the progress of eystematic $B$ may conclade this attemit to elucidate ats leading priaciples Onc of the earliest methodical mrringenents his hat of Casalpanns, " Ruman physician attached to the court of Pope sixtus $\mathbf{V}$. This was entirely artificial; and the Morison, Rivinus, and Tournefort. That propounded by Tunrnefort was for a long time adopted by the Freach schoul, bat was ultimately displaced by the attractive scheute of Linaread, whu must be louked upan as the great promulgator of the artificial method of classification. The first attempt at arranging plants according to their natural affinities was made by an Englith hotanist, John Ray, ia the year 1682, His bcheme was decessarily very imperfect, for the nmpler of plats then
known was comparatively small; stillit was in its jeading features correct, and las really formed the fuindation of every later system. It was long uegleted, and did no the fiell, and developed Ray's views of the natural affinities in the vegetable kingdom. Jussicn's nuethod was firet made knowa io tha year 1789, just eleven year after the denth of Linneus, Since that time, the matnrill methot lits been advanced by the labors of De Candolle, Brown, Endicher, Liadley, and many others.Geagraphacul Botany treats of the manner in which
plants are affrect by clinate and station, and endeavors to determine the conditione under which particulit families or species of plantsare confined to certain zones of latitude and altitude. It is a study of great interest, and wae which canonot be Euccessfally prosecuted with of course so lung is there are vast tracts of continces Of course, , which this demutment is founded must be imperfect (Sce Distainutioy of Plavts.) - b. Fossil Bolany investi(See Distamation of Pharrs.)- the nature of the plants found in a fosil state io gite varims geological formations. It is therefore at onc A liranch of butaity aual of feelogy. (See Paleonsoloor.) The practicul bearings of botany are must important, ond are sumetimes treated separatcly in manuals of th science, under the head of Ecunomic Bntany. All the principal plants affording food. timber, uedicine, flires, dye-stunf, anif other useful prodacts, are noticed in this
work under the names of the genera which inclu For further details of the structure and classification of plants, the reader may consult with advantago Lindey table Kingdom, and the works of Balfour, Henfrey, Henslow, Olivir, and Asa Gray

Bramtome, Ptiare de Botradilles, Seigneva de (bratilume, a French clironicler, B. in Perigord, about 1540 . Ile travelled in several combtries in the capacity
of chamberlain to Charles 1X. and Ileury 111.: fooght against the Huguenots (1562), in Bartary (1564), and went in 1566 to Multa, to fight against the Torks. After his return to the conrt of rasace he retired jato private life, and wrote his Memaires, full of selt-prsise but very interesting, as they afford a lively portraiture of the thanners and moratity of his times, the weing very severely bandled. The style is ticular, being very severely bandled. The style is charmingly piquait, full of ingenious turns of expresquence, and withal so neively simple, that if the ruthor cronot, on recoopt of the abundance of his gossip, le reckoned a grave bistortan, be nust needs be considered unst fascinating chronicler. D. 1614.

those vast tracts of land of which Pard is the capital in ot aiture proceed here on the gradest the operations of anture proceed here on the grandest scale. Swarins of his fielh. Dronghts are frequeat aod loog-continning. Flowds in winter commit mischievous depredations, Latterly, epidemics have swept off large tumbbers of the inhathtants. All these things oaturally conspive to check the efforts of the cultivator, and
the tlonbt is sngrested to the bind of an olserver the tonbt is snggented to the buind of an observer whether any real progress is actually being naite.(CTum.) In the corthern parts, and in the neightor-
hood of the Amazone, great heat prevalls: in the bugher hood of the Amazone, great heat prevails: in the higher
purts, adod towarib the sonth, the climate is more temperinte, and eveu cold, the thermometer falligg as low as nte, and eveu cold, the thermometer falligg as low as
$44^{\circ}$. The climate in the vicibity of sio Yaulo is usually acconnted the most ayreeable, and the temprature permits the growih of European truits. The W. Wind in the ioterior is unwholesome, as it passes over vast marshy
tracts of forest. The sea-coast, from Para to Olinda, tracts of forest. The sea-coast, from to Guiaco. Nut withstandid, the position of $B$. between the equator and the tropics, the arr, owing to the height of the greates portion of the conntry, is in general temperate, rather than hot. Perbambocn, and a few of the orher province suffer occasionally from drought, to which, however, the cuast lande are seldomsnbject Mi Rio suomed up the bamernt peculiarities of this ciimate, thus:-"Winter in this conotry resembles summer io the N. of Europe simmer appeary ode conticuons spring; while spring and autumn are uncenscionsly lost in winter nod summer:" ( $M \mathrm{~m}$.) The most celebrated of the mineral productions of $B$. are diamends. Thuse fuand in the prov, of Minas Geraes are generally the largest, and the most celebrated mines are thuse of Surra do Frio. E-chwege cetimates the annual yield of these gems at an average of
$15,000 \mathrm{carats}$, aod an assesbed value of $817, \mathrm{in7} 7.655$. Gold 15,000 carats, aod an assessed value of $\$ 17,377,655$. Gold
is fonnd in severat localities, but the must celebrated is foand in sever.al localities, bht the duest celebrated
mine is that of Congo Soev, whels was disposed of, in mine is that of Congo socy, whed Kut disposed or, ira1825, to a body of Englishmed. Now actuat produce of the
zitian Mining Co, (Limited.) The entire gold and silver mines of $B$. (includieg washings is uot believed to exceed pore thand $\$ 1,000,000$ acuaally Irou ore is nbludaotly fouta, as, amo, varicties of pre petre, amm, platuaa, copper, the vegetable products of $B$ must be classed sugar, coffee, cocoa, rice, tobaceo, maize, wheat, nandroc, ginger, yams, sarsaparilla, and maty varieties of truphethems Of these, the most important, in a commerchal sinse. are
sngar, coffee, and cottos, which are oow, in point of fact sngar, coffee, and cottug, which are and the cnlture uf whicb is being increased with atmost unexamped rapidity. Sngar is principully raised io the prov. of samut it is also extensively produced in some of the wther jurovit isces. The culture of cultou is of more recent growth inces. and its extension uwing in creat part to the Americab civil war. Coffee is friucipally grown in the neightorhood of Rio the capital, and tolvacco in the islinds in the hay of that city; it 15 , however, inferior in quality to that of the U. States. Rice is largely cultivated, and is exported; but the principal depeadeace of the population is on the mandioc, manioc, or cassava (Jatropha Manilnot), regarded by the Indians as a liequest from
theit proplet sune. It is found on every table in $B$., theit proplet sune. It is found on every table in ${ }^{\text {s. }}$,
and surplies a great number of excellent dishes. Not withstamling her fertility and exfent, $B$. is indehted to forcign countries, and especially to the $\mathbf{U}$. States, for large supplics of wheat-flour. This has beed said to be cultire of wheat: but this does not really appear to be the case, that species of grain being found to flourish ex tremely well in the S. provinces, and on the table lands of the interior. The importation of flum is rather a consequence of the indolesce of the nutives. The prov, of Pará is peculiaily htted for the production vi rice, and might supply it in any guabtity. The culture of the teaplant har beent trimd in $B$, and the bound fivornhle to its growth: but sts culture has been found fivvornhle to its growth: but ite culture has
 carried on where labor is athomant and cheap; whereas it is bure hotheesrec and dear. The forests of $B 3$., which are of vast extent, und teemmg luxarimace, furnian al productsy variety of nseful and ormamenting, carjenter and cabrinet-work. llyeing do. Bretz'ville, in Indiana, a pust-office of Dulpis co.
Hreushell. (broi'gel,) the aume of a celebrated family of Fhemish painters, - 1. B., Petes, the suo of a peasant Breda. He Breughel, a village in the neighborbood of Breda. He was placed under Peter Koek of Aalst (Alust)
whose daurgter he subsequently whose danghter he subsequently muarried. Having France and Italy. He took many views by the way France and Italy. He took many views by the way,
particularly among the Alps. Returning from Italy,
be fixed his residence at Aotwerp, and wasadmitted into the academy of that cits in 1051 . Here he lived for a long time with a mistrise, whom he would have married, but for a babit sbe had of lying; which so dis pleased hing, that be transterred his affectinns to the daughter of his old master, now dead, and obtained her hand upun condition of residing at Brussels, where she lived. As he lay on his death-lfed, he ordered many of to painting, wia io his presence. The dates of his birth and death are unknown - lle painted chiefly con birth aud death are nanuer of Jtrome Buscbe, whom he excelled; and he has bern eonsidered ly many inferior to Teoters alone in that branch of art. Blis composition has beeth objected to; but his drawing is correct and epirited, though not very highly finished. It was his frequent custutn to disguise himself and mix with the peasantry at their festivals and games; nud the happaners with which he transferred the living actions he thus witnessed to the cauvas, has beea aptly compared to Moliére's, though in a diffrrent kind of sitire. Besides conic subjects, he painted latudecapes, and a few historical pictures. Two Brussels alrout 1570. He recelved the first principles of his art from his father, and for some time be confined himself to fower-painting; but travelling into Italy, he enlarged his style, and painted lindscapes, which he rectocos and beanty. Many painters availed themselves of his liberality, and indnced him to earich their pictures with his beautiful little figures or landscapes; nmong them are Steenwick, Iav Baeleo, Rotenhawer, Momper, \&c. Even Kubens made use of his skill in more than one picture, in which Ruliens painted the figures, and B. the landscapes, flowers, animals, and even msects. JAN $B$. Was extremely industions, as
the great number of his pirtures, and the care with
which they are finished, rich by his indnatry, he cultiviteda magnificence in bis apparel and was nicknamed telvet $B$. from the material of his dress, which was a costly stuff. His tumeh is light and spirited, his drawing correct, and his finish elaborate. His pietures ore much aituired, although his landscapes are injured by an exngerated blauness in the diatance. D. about 16t2, - B., PETER, the eldest sou of Peter B., was the pupil of Gilus Cotimgsloo. Frotn the dabolic nature of his firorite subjects he lasa been survamed Moltish. He did not nttain the eoninence either of his father or brother. B, 1569 ; n, 1625. Brenninerite, $n$. (Min.) A native carbouate of mugbethletl rhombuhedrons, in chlorite-slatenad serpentitue. in varions parts of Frazce and Germany, anong whosi in varions parts of France and Germany, anong whins
earifest works are reckoned the $B$. of Avighom, over the Rhone, and that of Ratisbon. A fresh itmpulse was given to B-building in Fratuce by the extablishmmat of the the Pont de hi Concorde at Paris, and many other motable B. at Blois, Orlvans, and siamur, add in variouparts of that conntry. In England, the first stone $B$, by Otd London $B_{\text {., in }} 1176$. Is 1775, Mr. Pritchatil commenced the construction of cast-iron B.. by puttith in one at Coalbrookdale. Since the commoncencut of the present cetitury, the art of $B$.-buililiug has rupilly de veloped itself auter the repuirenents prodaced by the introdnction of railways and the iocreased lacilities the suspension- $B$, the wroucht-iron girdur $B$, the suspension-B., the wrought-iron girdar $B$., the latEngland in the Menad and Chelsea buspension- $B$., the Englatd in the Menai and Chelsea mbspusion- $B$., the and Saltash tubular B., the last-named of which is atsio, known as the Albert B. In Fig. 419 we give an illastration

Fig. 419.- britannia bridge,
of the Britanoia Tulmlar $B$, showing also the Honai snspetsion $B$. in the distatice. One of the most remarkahle land. The Victoria B.over the St. Lawrence, in Camada, is the largest tnbolar $B$. in the world. In molern times, the Wooden B. of Germany and France have taken hijh rauk from their scientific combination in arramgoment, bot the U. States justly claim the precedence for simplicity, mechanical perfection, and boldnexs of design, as exemplified in the magnificent railroad bridges in many parts of the Union; and also in those over the Schuyikill at Philadelphia. The first smepension B. in the U. States were built by Mr. Finley, between 1796 and $1 \times 10$, and were all of small dimedsions, and constructed with chain-cables; but during the list 25 years, a harge num-
ber of stroctures have leen erected, some of large size, the plan of wire cables being generally adouted in their cunplan of wire cables being generally admpted in their cun-
strnction. Anong these we notice the fine suspundu- $B$. built in 1869, over the Niagars River, almost immediately below the great Cataract, and ne:rly 2 m . abore the Ruilway Suspenstoth-B. Its total length is $1,268 \mathrm{ft}$. The lobigth of the suspeoded platform is $1,240 \mathrm{ft}$. : height above the water, 190 ft .; length of part resting directly ua cables, 635 ft . : height of towers, 100 and 105 ft . ; basc of towner, 28 ft . equare; width of rosdway, 10 ft . The two cables are each 7 inches in dianeter. Io wronght-iron $B$.
we will mention the magnifient $B$ aver the 0 hin we will mention the magnifisent $B$. over the Ohin at stentienville, completed in 1863, cimsisting of 1 spaus
of 235 feet, 3 of 210 fep , and 1 of 320 feot. etely; total length 1,890 feet, with a chamnel span of 9 ) feet alove the water. The Newport and Cincinnati $B$, a high permanent structure built across the same rivor, fir It has ons span over the chanalel of the river 420 fect in leagth; the iron superstrocture is aboot 1,700 fent in longth, and it is approached at either end by a Aeries of briek arches sustaining the rail and roidways.
This great schievement was completed in 1870 . And, also, the bridges lately built across the Mississippi, Hamely: the cobucy, the Barlington, the Kutbok and fer, completed in Deconder 1868 , 1 sur $\frac{1}{}$. 35 feet, completed in Decomber, 1808 , has 4 spans of length, $1,760 \mathrm{ft}$. The $E$. at St. Lonis, completed in 1874 , at a cost, inclading tannel, $4,800 \mathrm{ft}$. long, of \$10, 000,1000 , is a grand work; it has 3 arches of 501 it . earh, of caststeel. The crowniog achievement of suspension brnige engineering is the bridge rast acruss E., 又t River, wharh
was completed and opened for travel in 1883, and which was completed and opened for travel in 1883 , and which
nnites the two sister cifies of New York and Brooklyn. nnites the twosister cities of New York and Brookl

great size; the magnitnde of onr rivere, the heavy ex juspe, its well as the monont of time required the the pressang wats of the comatry. The finest are, perhape the Iligh $B$. of the Croton Aquednet, over the Ithrlen
River, int N.Y, anil the "Falls" $R$. orer the Schuylkill, fur the Remding IS. H., ut Plilateljhia. As this houk
 is not intended tor the instructun ot engineera, we will
not enter minto the disenasion of all the many point of itnportatuce to be considered bothre derigiting und pieco inting the constructing of A B. nctoss whe some consilderatlons on the construction of the Anco in E.ebuidding. The terlanich ternas comployed in $B$-huildings with regard to the urch wail be fotha nuder the word Aach; bat it must be addind that the nassers of masmary erected at cither end of the B., which generaty sustan the thrast of the whole series at uritheo from which the archert sping, pters, and the filling in betwen the zops of the wreluse and the rue filling in spundrit. It may also bee remarked, that the term arch is applicd to the stinctore of that torm when mate of stone, brick, or cast-iron; while itn B. of word and dothenty in determaning the form whice is considerable to have, in oretermang the form whel au arch onght possible, whan it his to strength maty be the grivitest uwn weight; in fatet, such a dibcrimmation catanot be ofenrately made, nuless we knew not only the waghe of the abaterias the arch has to support, bat also the saly, unless we know the mmount und direction of thi pressure on cevery puint of the arch. Supposing, luowever, that the arch has to sus-
tain oaly its ow w weight, and eupposing the friction of
the arch-stones the arch-stones
is reduced to nothing, a rela-
tion between the carve and
the weight of

## 0

maty be found by comparing the pressures which are ex erted on the different joints. Thus the pressure on any joint, $s$ q for example, urises from the weight of that portion of the arel which is betweet $s$ s and the sum
pit C In. Now, the prortion of the arch C . tained by three finces: the pressure on the joint s the pressure un C 11, and its own weight. Let $s q$ be
prolunged till it meets C D in $O$, and let $n$ be its inter prolunged till it meets C D in $O$, and let $n$ be its inter
section with A B. It is a theorem in statics, that whe a body is held in equiliurimm by three forces batancing each other, these forces are propurtional to the three dicalar to the directions of the farces. The three foret anstaining C qs in are, therefore, proportional to the sudes of the triangle $0 \mathrm{D} n$; for the propessure on s $q$ acta in the direction jerpeudicular to $s \eta$ or $0 n$ : the pressure on C II is perpendienlar to $\mathrm{D} O$, and $n \mathrm{D}$ is perpendicolar to the direction of gravity. The pressure on $s q$ is, therefore, to the pressure on C If as in D to D O.
In like manner, the voussoir $p r q$. beige so shaped that $r p$, when prodnced, meets 0 Il in the point $O$, thu pressare on the joint $r p$ is to that on CH as $m \mathrm{D}$ to D
O . Hence, the presisure on $s$ is to the pressurs O. Hence, the pressure on $s$, is to the pressuro on $r p$ as D $n$ to D $m$. We are thas led to infer that the vons the piers, proportionally to the limes D $n$, m-stone to in this case, the surfates of the joints being increased in proportion to the pressare they sustain, the pressur on every point of the arch will be equal. It will atso be olserved that the angle $n 0 \mathrm{D}$ is equal to the angle made by a tangent to the curve at $q$, and the horizontal ine parallel to A B; the angle mOD equal to that made by the tadgent at $p$ and the horizontal line; an bine radins D O remaining comstitat, on is the tangen of the point of these ingles, and D $m$ of the oucond hence the pressures on the successive joints are proportional to the diff-rences of the tangents of the areher intrados is a circle given. in position, atherty, whels the he $k \cdot y$ stone is given, the curve. of the extrados may the ki'y stone is given, the curve of the extrados may tin the arch of equilibration is a catenarian enrve, or curve having the form which a flexible chain of uniform thickness wonld assume if hanging freely, the extremi-ti-s heing su-pendid from fixed puiuty. - See Aquentct Vhocet AND Biscule, DrAN, FRiME, Floitivo, Llitice, Pile, Powtoon, Se

 A whight splusmalic action, ha order mily to wromplisht urily explained thee reamon of this. Some of then nir velly, purtionlariy romad the ellten of the lunge, now rapturad: they have run into one anuther, and Irregnlarly Armol cavities have thut buen mallo intow which tha wir rons cusily enter, but crannit, withont considerable dialy a charucterist explained hy this aurbid netuctire of the lumge. If thi, unum breathug hus hern rendered thus hamerinas, it in
r-vulent that the hrour, without "kilful mangmemont, will in attarly inrapalute of rapid anid continued exerthon.
 dintreas, sind If ntill nrgew on, lee dreps and dies; thix The canse of tho rupture of tho nir-cells nay be pro-
vione inflammation of the loogs, by which a portion of them has been reodered inpervious, aud thus greater lathor throws on the remaming parts. The dencate
structore of the cells, probably weakened by the inflamstructore of the celle, probably weakened by the inflam-
mation io which it had shared, yields to the onatural mative io which it had sbared, yields to the onsatwral
distention to which they are thos exposed. Many a horee has become brukeo-winded when arged to extra exertion immediately after be bas been fed; for the air rushing violently into the luogs in the act of sudden and forcitile inspiration, and the thll stomach lyng agaiost the diaphragm, with which the body of the linge is io coutact, their purfect expaasioo is preveoted, and those parts, as the edges, which are tree from this press Eure, are unaatorally dilated and raptured. The kind of foud also to which the horse is accostomed has uuch
to do with this distase. If it is comparntively innutrito do with this distase. If it is comparatively innutri-
tive a as frater bolk of it unget be eatem, and the distended
 stomach wilf ofteler and looger pross opon the diaphagu
and impede the dilatation of the loogs, or render it noequal 10 different parts. Thus, brukeo-wiad is a disesse
 oftea prodnced in the straw-yard, where little uare than the cuarsest fuod is allowed, but it is comparatively seldom even is the stable of the cuach-proprietor, in u hich the food is of a better qoality, nod lhes in a sualler com-piss, sod is mure regularly yimmioistered; and it never
disgraces the hunting or raciog stable. It most how-
ever be confessted that there if bometimes an hereditary ever be coofessed that there 18 sompetimes an bereditary predisposition to this disedse, collsisting in a barrowness
of chest or a weakness of structure io the loogs. There of chest or a weakness of structure in the loags. There
is no care for broken-wind; no urt can reeture the dilatel is no care for broken-wind; no urt can resture the dilatel
cells to their former dimensions, or buidd up agaia a wall cells to their former dimensions, or build up agais a wall
between them. But palliative measures may te allopted to a very considerable extent. The food shonld be of a avore nutritive kind, and contained in a smaller compass. straw ind chaff shoold be forliddea, the quantity of hay perbaps a little dimioished, aod that of corn correspondingly increased. A mash shuuld constitote a part of the evening's fire: water shonld be spariggly givea during the daty, nnd exercioe shonid not berequired when
the stonach is till. Occasional or perjodical fits of greater difficnlty of breathing should be met by enall blecedings and gentle haxatives, By this manazenent not uoly will the liroken-wioded horse he rendered ase-
fill for many ordioary purpmses, but will be capable of fill for oaay ordioary purpuses, bnt will be capable of
service and lathor, which it would otherwibe be cruel to Brohern-wibiled, $a$. Having ashortened respiration,
srah herse.
Broker, $n$. See Bange.] One who does busioess for Broker, n. [Seo Bange.] One who does busiaess for business for merchants; as, a ship-hroker. A broker is a surt of middleman between veodor and purchaser. He is nat, like a factor, intrusted with the phossesxiou of the article he vemis, nad he is pot authorized to bny or sell 10 his own name.

-One who doalx io old furniture, goons, \&c., or who sells perronal effects, dce, ufter being distrained opon for -A pimp or procurer. (o.)
Brotheragre, $n$. The busioess of a brolke
Brokerage, $n$. The busiaess of a broker.

- The perceut, pe paid to it bruker for hid trubble in effecting a aale, or in negotiating any particular busineess. Bre'king, $p$ a. Pertuining to the basiacss of a broker practised by brokers; relatiag to brokerige. (o.)

Bronchilis, (bron-ki'tis.) h. (Med.) There are few Whass anectiog the respiratory or gan more comonon and anre serious, thate tbat form of inflammatiory actubes, or any form of disease calling for more promptor energetic action. The great exciting cause is coli, especially wheo combined with molisture; but, whatever teads to dimiaish the generst vigor of the system, and excesses of every ature is apt to produce it It is espe cially prevalent duriog the spifog monthe. Its first symptoms are emederslly thase of a commen cold iecompanted with no uccasional congh, and a sease of weariness and beadiche. The congh increases, and there is a feeling of oppression in the chest, and the breathiog produces a kind of whezing noise. The pelse is rapiri and weak, and there is extreme lassitule, with pain in the limbs, mental heaviness, so. It the feverish symptoms iacrease, the breathing becomes difficult from the clogsing of the tubes with nucus, which is, to some extent, expecturated daring the congh. 1o severe cases, breathiar becomes so more aod more alarmin; the no lunger lis flowo, but reguires to maintain an upright ponture, and use all his muscles io respirition. At last, he is 80 exlransted that he ceases to expectorate, sod dies of suffucation from the accumulated onens, nsuatly in from five to seven days. Evees in less severe cases, the delicate reapiratory tubes are frequently permanently injured, so that the proper aeration of the bloul is iaterfered with. The treatment of this disease will vary, acsordiog to its nature aud the constitetion of the prat-
thent ; and the necessity of always haviog recourse to is
medical man cannot he too strongly insisted upon. The great objoct of tho treatmont is to refiuce and remove
 bathed in loot water bed warm tilacht druks, wa far ley-water or litased ten, kivem. It is trequently necesmary tor administer emotios, in order to remove the neconerately upen darang the whute course of be kept mod Sere Astita 1. Catakhin, Coegif,

a short excursion into New Jersey and New York io the summer of isul. Finding this was of no effect, he agreed
 manners were gentle and und ffected: hnd has ronverat
 silent io harge or mixed companics. His rembins, thankh log ouly too great, is it indncod bins to compuse story after story, trusting appurently to luek firm the discntanglement of his plots. We threw uff:s rumumes in ont year, "with the printer s devil literaly mi mas often deficient in ense aud simplicity: mal he was apt to stop short in the pridst of his unst exentiog narrations to philosophize upon them; but has ronunces were moth admired in his tince, mat are still read with interest. He had a powerful lut smmewhut murbi intensity of conception.
Srown, Jacob, an American general, B. in Bucks Society of Friends, he was one of the pionecrs of J.fier on co, N. Y. In 1812 , he joined the malitia sipvicy as a militia general. Ile was appoiuted major-gincrat in the regular service in 1814, and distiuguisheel himself it the hattles of Chippewa and of Niagara Fills; alsul at the
eiege of Fort Erie. He received the thanks of Congress and a gold medal, emblematic of his triumphs. (irn. Ib
Brown. James, an eminent American puthisher an buokseller-the "Johu Martay," as he was called, of the ton, March 10, 185\%, aged fifty-five. The snn of a former in very humble circumstances, it Acton, Mass, lie raised himself by his shrewdeess, sagacity, and enterperse to bo the hend of one of the largest and most succeafinl firms is the hook-trade io America. Their publications wer 6tandard works of a bigh character; and Mr. Hrown
fine taste and patriotic pride were gratifiod by fine taste and patriotic pride were gratified by in
improving the mechanical execution of them-the improving the mechanical execution of them-the piper, print, and binding-that they rivalled the hand-
somest productions of the Euglish and ficoth li pross Bomest productions of the Euglish and scoti h pross anticipation of the public taste deceived in his gigantic enteculations. He was himself well socquainted with bibliograpby; his shop was a favorite resort of all the literati of New Eugland, aod he never forgut the mame of a book once inqnired for, or the well-cotssidetell judgment of a competent persoo upoo its merits. The for
tune which be had fatirly won was punvificeatiy used in tune which he had fairly won w
nnmerons liberal bedefactions.
Brown, Jons, the founder of the Brunmian system,
in Berwickshire, En-ulad, 1735 . He disilemi, in hi in Berwickshire, Enylaod, 1735 . He drviled, in his
famons system, all diseases into stheme and itsthenic famous system, all diseases into stheme and asthenic; the sonrce of life, was increased, white in the second. it Was diminished. The treatment to be adhpted for the late. Accordingly he prescribed tich diet, wine, and spirits io large quantities: and, as the physicians of that day probably erred in the oppusite direction, it is not etrange that, for a while, $B$. obtained a high reputation.
Towards the erd of the last century the Brumpian syan Towards the erd of the last century, the Brunonian sys-
tema had extended its influeace over the whole continent tera had extended its influace over the whole continent of Earope, and in Germany its author was designated
the $M$ dical Luther. B. professed the greatest contempt the Mrdical Luther. B. professed the grentest contempt
for all systems of medicine which had preceded his own, for all systems of medicine which had preceded his own,
yet it is obvious that he wiss less original than lue as yet it is obvious that he wis less origimal than he as-
eumed to be. His faculty of excitatitity is the llallerian eumed to be. Ins facuity of excitataty is the Halleriat is justly remarked by Bronssais, it takes the rank of an ont fancy as was the Archecus of Vau Helmont. But there ia a great merit which belongs to $B$., nod dea to be remembered, oamely, his appreciation of the fact that disease, in by far the greatest number of cases, im-
plies a debilitated condition of the orgaoism. D. 17 h 8 .
Brown, Jogs, an officer in the Americata army duriog the Rovolution, was n. in Berkshire co.. Mass., in 114t graduated at Fale Collcge in 1i71, and commeuced the
practice of law at Caughoawaga, New York, where be practice of law at Caughoawaga, New York, where he
was appointed king's attorvey. But he sunn roturecd Was appointed hing a attoruey. But he sorn retaroed
to Pitefield, in his native state, and tuok no active ehare in the patriotic anvemente at the opening of the Kevolution. Io May, liin, he served under Allen and
Arnold in their successful expedition agaiost licamle roga and Crowa Point, and was seat ns sporinat messenge to the Congress at Philadelphia with the uews of theif success. When Ethan Allch, in Sept. of the kame ymr
made his attempt to surprise Muntreal, B. co operaten with him. but was fortunate enongh to essape, while his leader was captured. The next Dee., Hajor B. juinen Arnold and Noutgonery before Queluc. While lemling

(Physiot. Vegetahle) The organized rudiment of a bratuch (leaf-bud), or a flower (flower-bad). Whatever becomes a branch is, when first organized, a bud: bat it dows not
therefore follow that all buls become branches; on the therefore follow that all buls hecome branches, on thich
contrary, owing to many disturbing canses, to which reference will presuntly be made, beds are snbject to
traosformations and difornities which mask tharir real nature. A lraf-bud is construeted thas:- In its centre it consists of a minuto conical portion of sofe socculent cellular tivane, and over the surfoce of this are arranged are closely applied to each other; these on the outhide are the largest und thickest, and the most interior ones are the smaliest and bost delicate. In coll countries the external ecales are often covered with hatir, or a resinons varnish, or some other contrivance, which enaties themi to prevent the hey protect: lut in warni cuubtries where such a provision is uot required, they are green and emooth, and much lena numerous. The cellular centre of a lud is the sent of its vitality: the scales the parts towarils the development of which it vital energies ara first directed. A leaf-hand usmally originates in the axil of a leaf: indeed there are no leaves In the axil of which wne or more buds are not found
either in a rudimentary or a perfect state. Its cellular centre conmanicates with that of the woody centre of the stem, und itssicslesare in connection with the hark of the latter. When stems havo the structure of Exogens the bud terminates ono of the medallary processes : in
Endogens it is simply in connuanication with the cellu lar matter that lies between tho bundles of woody tislar matter that lies between tho bundles of woody tim
ane in nuch stems. It is noreover important to olservo that this is true not only of what are called normal beds, that is to any, of buda whels originate in thenex of the lrafy organe, but also of adprnetiones buds, or sach as are ocrasionally devolopent in unusual sithations. It would scenu a if, wher favorable circumstancrs, buds may bo formed whorever the cellalar tivesme is prose ent; for they occur nat only at the und of the medul-
lary processem of the root and atem of exogens, but lary processew of the root ind ntem of exogens, but
on the margins of leaves, is In Rryojugilum, Ma-
 laxis palelda, and many others. A leaf-ind has threi
special properties, thonew of growth, ettrartion, and prn pagition. In warm damp wenther, noller the infln enco of Hight, it has tho puwer of increasing in

1. Leaf.buts. Fig. 4.19 . body It muy the eventibilly dewtinell for, An monn ma

the sap from that part of the stem with which it is in commnnication; that part so acted upon attracts sap in its torn from the tissue bext 1 , and so a general moveby which fresh sap is alsorthed frum the suil. Thus is cansed the phenomeaon of the flow of the sap. Every leaf-bud is in itself a complete body, consisting of a vital centre, cosered by nutritive organs or bair. Although it isordinarily called into life while attached to its parent phant, yet it as cipable of growing as a separate portion, and of prodncing a new individaal in all resperts the propuguting organ as much as a seed, altbongh Dut of tho Gane kiod; and advaatage has been takeo from this for horticultural purpuses. (Sce Buapinc.) In geDeral, terfered with or destroyed by several causes. This imit bo exident from the followiag considerations inde pendently of all others. Every one kuows that leave urearranged with great symmetry ppon young tranchets ns bulf are axillary to leaves, the branchea they prodnce onght therefora to be as synonetrically arranged as deaves ; nad this we eee does not happen. We may ac count fur this in two or three ways: actilental injaries
will doulutless destruy soule; from want of light other will doubtless destruy souse; from want of light other
will never be called into action; und of those which are will never be called into action ; uad of those wather destroyed originally excited to groweh a part is noways destroyed
by the soperior vigor of nelghboring ladt, whichattract by the soperior sigor of net them. There is morenver in many plants a special tendency to produce their leaf many plants a special tendency to procucether
buis in a stunted or altered state. In Fir-trees the side-hurls push forth only two, or a small mumber of Jeaves, and aever lengthenat alif in the colar or bebanon points, and reacnable short spurs; in the Sloe, the Whate thorn, and many other plantx, they lengthee notre, produce bo leaves except at their very base, and grow into hard sharp-pointed spines. Bullos are nothing but leafluds (Fig. 439), with unusually fleshy scales, and with
the prower of ecparating spontanomily fron the mother the power of beparating apoztanconaly fromi the nother
plant: and fluwer-bods ase theoretically little more than plant: and fluwer-bads ase theoretically little more than lear-buds without the fuwer of lengthening, but with
the organs that cover them in a special state. Ifence flowers aro godified branches. - Sce Flowen. an animal as a bud bluws into a Hower -r.i. To put forth or produco young ahoots, bude, or The budding rowe above the rose full-blowe." - trordsworth.
-Tu germinate ; to begin to grow or shoot forth.

China, where it will be examined nador the name $300,000,000$, the entire populatiou of the earth, $-B$. bas not been stadthe entire popmatiou or the earth, - $B$. has not been stadples are hetter known thin therse of other religioas without excepting our own; all the details of the life of its founder have been recorded in the archives of histery and we are in possession of all those canomical writinga wherein are deposited the doctrines deciared ond de fined by 3 successive conucils. These borks, at first written in Sooskrit, or in some dielect of thas language, have been translayd into the idiomo of other mationis anong which the Budduc faith was prophgated, as the
 praushations, which secnre to 18 \& truthful and infallible knowledge of the origimat works. The most succeosin! investigitor in these minertant mustery of researeh was Mr. B. If. Hodgron, appriater! in Ix2l British Politival Resident at Nepau, for the East Indar Company. He was informed that io Budrlic mozieteries were reli gionsly kept mannscripts said to contain the canonical ductrine of Buddha, which works were writtea in the Suaskrit tongne. Mr. Hodgron lud a lint of these writings, remitted to en old Buddhist priest of Patan, and The Thibetian tramblations were evell more easily po cured, for in that country books were almust as numer ons as in Eurape, being reproduced by woudelurnviag, which alt had been inforted into that wantry from China. Mr. Hodgron achered this impurtant result in $10 \geqslant 4-5$, and at the same time lie offered to the Roynd Astatic Societies of London and Paris, 60 Juddhic wolumes, and 200 in the language of Thibet. The same offer he had previonsly made to the Asiatic Society of Bengal. Almost abont the same time n yonng llangarian physician, Mr. Csoma, from Koriis, in Traheylvania, was equally auccessful in making discoreries, startiog raeame be jenertated ioto 1 bibet acquirid the innemy raeans, be peactrated ioto thibetacquird the maguggo
of that couotry, and read the great works naned the Kahogoar and the Batomgoor. These two cricyclupas dias, the first in 100 vols, the second in $2 \boldsymbol{2}$, vols, printed in 1731 in the monactery of Snsarthang. in Thituet, wern a full translation of the books brought frum Indix, and everything pertaining to Buidhic literature. Mr. Camm gitye, under the anspices of Mr. Wilson, the ithetrione Orientalist, and metnher of the Cafchrtir Asintic somiety, an amalysis of the two works, and in that edithon wree funsil almost all the sanskrit books discuverell by Mr. Wilson at Nepaul. Mr. Csoma died young, exhansted by his great hething belind hime in a worh which is treasure of Asiatic reseatch and which cunsecratica his tryasure of Asiase Mr. L. J. Schmidt, a nemiler of the st. Petershury Acadeny, demonstrated that nearly all the Budulhic works transluted in Thithetinn were translated also into the Jungnlian tongne, and under the same conditions; thus bsppily confirming the asertions of Mr. Hodgron, while other coufirmations were still to conse from different conntries. In the $\mathbf{S}$. of the islatid of Ceylon, where B. was known to have penetruted
three cunturies before our era, Mr, Gcorgo Turnuur three cuntaries betore our era, Mr. Georgo Turnour fonnd, aluost in the snme shape, the cunonical hooks Ife discovered that tho Cingaleat priests were in prosses brourlit tu Ceylon by a curtain 1udian bince a wotector brought to Ceylon by a curtain ludian hims. \& jrvtector language, a \&unskrit dislect. Thees l'uli writinge, 17 in number, are almost identical coypien of the fortha of 3lagadlar and Netant: they atoo contain the lifo nat doce trimal systed of Buddia. So that in the North, the太anskrit version of Magadba was the text trom which the Thithetian translation was made; while in the Sunth, the lati version, from Ceyton, was nemen for the siamere and Burmanic trunslations, the ishand of cylon (the Taprobana of the Ancient Books, from the linutan Tianrapanna) having alwnys tuen in religions necord and
relatinnslip with Sinn nod Burnuals. But Ceslon had retill roumething more. Busides the encred velumen, the pricats lund whitton chrunicles in whicl were reconlat year liy year, the most importunt facts fouching their religion and history. Mr. Turuohr olitanmel the Cinga-It-ge anmis, and patbished the leading farte of that valuable work, the Maharemsa, and the nnalywe of muny others. These historical works, the only one fratucet hy the Hitidoo genias, go back to the conver sion of the ishand to Buddhisth, and contain the lite of Buthlhe mad his religions truditlone. Butoma'eese, r. pl. (Bnt.) An oriler of plants, alliseeded, netted, and parietal placente.-They are нquatic plants, with pardllel-veined leaves, seouctimes nuilky Flowers perfect and showy, with interior perinuth of six pieces arranged in two whoris, the inder being colored; ovaries soperior, 3 to 6 or mure; ovales numeroas, arraoged all over the inder sorface of the ovarits; frnit maoy-seeded, separating more or leas fito as many parts as thre are component carpels ; semis withont athamen. The Butrmacere chiefly inhalit the northern parts of the world, but a few occur in tropical couotries. There are Bitómus.
Butomus, n. [Gr. bous, hn ox; temno, I cut.] (Bof.) A typical species of the geans and order is yury comene in ditehes aod ponds in Furope. The leaves, which spring from the crown of the root, aru from two to three feet long, and of a triangular shape. The acape of flowering stem, is longer than the lenves, nod terminates in a large abibel of rose-colored flowers. The plant possesses acrid aod bitter properties, hod was at one time used in medicine. The roasted rhizome is erlible. The sharp leaves of the Butomus were beliered to cut the montbs of the cattle that cropped it-whence the Danie. But1, $n$. [Yr. fut, a mark.] (Gun.) A screen, genernlly natde of earth-work and maenory, hir protecting the markere dorth rithane which the torget leans, also called a bott.
Bnif. IBnt. n. [It. botto, a blow; botta, a thrust.] The striking end of a thingt the thick enll of anything: ns, ject of aim; as, an archery butt.

The growm his fellow groom at zutts defles,
And beodx bis bow and levels with his eycs.
-The person at whom ridicule, jests, or contempt are directed; as, he was the butt of the compatay.
"I played a sentence or two at my butt, which I thought very A pneh or thrust given by the head of an aoimal ; as, the butt of a ram.

- A stroke or thrust gireo in fencing.

## To prove who kave the fuirer butf, Joho shews the chaik on Hobert'i cont." - Pior

A mound of earth placed to receive the prejectile at proof of, and practice with, fire-arms.
A largt-sized cakk, sometimes called n pipe. A butt of wine contains 126 gallons : a beer butt, 108 ale gallops; and a butt of sherry. 10x imperial gallous.
(Ship-building.) See BLT-1 ND
-The metallic ring at the end of the hose of a fire-agine. The metalic ring at the end of the hoke of a fre-engine,
A lutt's length. The distance letween the phace of shooting and the mark
$-n$, ph. Short ridges of different hogth, which necresen rily occur in the angle of $n$ field when the direction of the ridges is not paratlel to one of the sides.

Butts and bounds. The lines loomding an estate. The nagles or paints where these lines change thetr direction. See Auutial.
Butt and
bate
Butt and butt, npoken of planks when they join end to End without overlapping.
13nit. Ni. 1 t . Luttare: W. protiano, to poke, to thruet, To butt. T To join at the butt-elid; to abut
Tif thrust the head forward; to etrike by thrnsting the head against.

Butting oas noother "-rrotion.
r. a. To strake by thrusting the head or horns against as a rum

By'ron. (Ggorae Gombin Xoel. Byrun.) Lotd, the great est Euglish poet of modern timss, W.is B. in Londen, biss lie was desconded from the Erabihavian Blainas, one branch of whish settled in Normandy, and came over to
Englad at the Numan Conqnest: while the ofher res mained io France and founded the honse of the duken de Biron. B. was grandsoo of the Admiral Juhas Byon, $q$. r., und the son uf Captain Iohn Ryron of the
Guards. By his muther, the heiress of the Scutish fanaly of Gordon of Gisht (and the secoud wife of Captain Byron), ha w is drscended from the royal honse of Stuart. At 3 years of age, $B$. lost his lither, nod was bronglit up ly his mother (a woman of weak mini aod irrititule temper), in the Scottish Highlanls, where to early inbibed that spirit of poetry and enthasi.sin for he succeedell his great-nucle as Lord Byron, and in 1800
 with his first love, the "Mary " of his puem Miss Mary Chaworth of Annesley 11.ult. In 1 vos be went to Cam. brivge University, and in 1807 published his first volume of poems. which at once bronglit him into note. But Idlenes", which appeared in the "Ellinburgh Review, evoked the manifestation of the real power of his ge-aius. His reply to it. publithed in 1803, is that marvellous and matchless sitire - Enylush Brads and Scotcr Revirobors Estranged from his muther by her peenliarities of tem per and disjusition. B. passed the first years of his earty manhood lonely and solitary, even amid the vortex uf
brillint society. Inme he hat none, nor yet a relation, excepting an only hall-sister, to regard him with syinpathy and affection, and open to him the quiecer charms of happy domestucity. Ahled to this dustris of ilumestic influmecs, his estate (imposverishet hy the reakcot-
reers of his father ind his areat-uncle) was inalugnetr to dnly ouaintain the disoity of his rupk. Flung un his own resources, he sourlit society aod companionship io the
fashivalde worh, where he, for it period, shone is a fashiunatue world, where he, for at period, shone is a
brilliant meteor, alikr distinzushed liy his persomal grace and heanty, his sparkling wit, and by the boturs ac quired by his genins. Tiringof, and mentally d-8jnsing the
fripperies and enpry conventionalities of the vay worlit sarpunaling him, herepaired to the continent of Europe and during his residence there composel the two first cantos of his areat poem, Chillie Herold's Pilgrianage He returned to Eughand in 1811 , where he armered erary reputation of any man of his tine. This was soon followed in rapid snecessigo loy the Giaour. Brite of Ahy-
dos, and Oorsair, anil, io 1813 , br Lare. In tann, 1415, he

BYZA

Hum in the year 324 , and spared no expense to make his new city the most maguificent io the world. At first, the pulaces, temples, churches, baths, and basilicas, braced all the characteristic features, of sfrailar buildimps ot Rume; but, to carry ont his grand desigus, Constantime caused schools to be establinbed for the otudy of architecture, in which mon were trained for the profem sun, who gradnally mingled new eod oricinal features with those of the atyle that had been introduced from the West, and formed a style of architecture peculiar in itself. rad eminently iuhapted to the requirements of the ritual of the Greek Clsarch, although bearing evident trace of the souree from which it origiasilly prung. $B$ A. has beetl divided, somernat arbitrainy, site roll periuds:-1. From the timeof Constantine to the minde reirn down to the elurouth ceut, which comprisus the greater part of the exiatiag boildings ot the pare Byzautine type. 3 From tha eleveuth cent. to the conquest of Crecce hy the Turky, when the iofluence of the Vepetiat successes is apparent in the intermixture of Italiat and Gothic detals and characteristics.-4. The prevalent form of the churches of the secont period or period of pare B.A. is that of the Greek cruss; the central square, formed by the intersection of the arns of the criss, is covered by a dome or cupola, and the spuces which represent the arms are also covered by semi-cupolas, or, in many cases, entire ones. The whols lengtit of the interins fand is the suse, in which stood the altar, divided from the next portion, called the bema, by a panelled screct richly adorned with pasintings and gilded carved work, fichy which were three doms of comnanuication between the berna and the apse, which was consilered to be the holiest part of the church. Tlse Roman, or semi-circular erch. is the otily form of arch employed, and the great distinctive conture of the style is the constant use of the cupola or durue, which was supported on arehes of a wide span, springing from masive piers at the finur corners of the central kpace. The capitals were adorned with foliage, generally of a oyminetrical pattern, in relief, on richly ornausented with scnipture, paintines and nus saic-work of moat elaborate description. The cathedral of st, Suluia, now the principal masque at Constantimople ( Fig. 458), built b;゙ Justiaian in 332, is considered
to be one of the finest existing kpecimens of Byzantine architecture. Goud examples of the style of thie secund period are also the third period are the churchee of St. Mark, at Veuice

Fig. 458. - THE MOEQUE OF ST. BOFHIA, (Constantinople.) (Fig. 3(0), and St. Pattocrator, at Constantinop!3. At ration, hut the churches were inuchsruallor inevery respect. The cburch of St. Authony, at Pulue, the cathe-
dral at Aix-la-Chapelle, the charches of Raventie and 1'ssa, are also Byzantige in character. In our own timen B.A. is the ecclesiastical form of architecture in Russia;
the prevailug style of the Greek Church, ns Gothic ar chitectore, is peculiar to the cathedrals and churches of Koblau Catholic and Protestiant countries.
Byzanline Cinirch. $\pi$. A nume applied to all those churches which acknowledge the supremacy of the cecnmenical patriarch of Coustantioople. The adherente of this chureb are comprised almost entirely within tho limits of Turkey, Greece, and Palestine, and are alto F-lumis.
Byzanifine, Lailerin, or (reek Enipire. See
Ilyzantine IIfstorians, a series of frect lituri
 the 6 th and 15 th cent. They may be divided into tliree classes :-1. Historians whose works form a confinuons history of the Byzantine Empire from the 4th cent. of the Christian era down to the Turkish conquest of Constantinople. They are nearly 30 in number, winh varions slades of ifterary ment; but their works constitate almost the only authentic sonurce of the history of that eventfal perioi. 2. General chroniclers, or historians whose works treat chiefly of the chronography of the world from the oldest times. 3. Authors who enufined manners \&c of the Romans. These two fatter chasece, combined rumount also to abous 30 , and their writings give on excelleat illustration of the tiones of which they treat. The works of the Byzantine historians, \&c. were collected and pablishell lyy order of Lauis XIV., in 56 vols. folio, Paris, $16+5-1711$. Another edition was puldished at Venjce in 1729 and the following years. A more complete edition was projected by Niebulir. he listorian of Rome (corpus sriptorum Fistrimio Byzantina). This edition was superintonded by him till hie death; ond it lans, since that time, been carried on ly Bucker, Dindori, nupl other eminu-nt philologists.

H1ank'enbaker* ${ }^{-1}$, in hy, a prec. of Jefferson co. Blasi'in\%. (Hining and Quarrying.) The componnd have nuw come to the frout as the sufest as well os tho nost powerínl of explosives, Ditro-glycerine or nitrat of glycerine, whs dimovered in $18+7$ by the Italinn chemist Sombrero. It is a pale-yellow oily fluid, of 1.6 EP. gr, which commenees to stifien and rolidify whew the temperature falls belnw so $\mathrm{C}_{\text {. }}$, or $4 \mathrm{~T}^{\circ} \mathrm{F}$. It is in soluhle in water, Lut can he mixed with methylateal spirit, henzole, nitro-benzole, or a mixture of alcohnal and ether. Against the use of pute nitro-plycerine a strong prejudice still exists in comseqnence jartly of account of its violent and sensitive mature und the rany arcilunts which luppebed in its earlier uulica fons. Xobel, the Swedith eliemist, wris the firs to tume its violence and to put it under complete custrol so far 18 safety was couccrned, hy maxing it with the fine in usormal earth so well kuowh to microscopiets, oni thus forming a simple mechanically phastic salustanct hathtier as w'fl askifer for ase for minitg and quarty ang purposes. Tha wnistole, fonsivimp of per cent of mitro-giycerime and 25 per cont. of silicims momi was proved. hoth as to safety and power, by numerons nutestimportant and convincing experimento, ond fous the pame of dynuruite. Thus compumidel the plati mass is of a tawny reddish lue, of a consinemey ne proaching that of patty set frit to in the upen sir, ily namite nurely deflagrites: it will evell hurn when eis closed in ordimary loxes, producing only elikhtly orxione cakes and very little or no smoke. It explode only in complet-ly closed spacts, and with liftionity liy mesus of ef arks. It may be, waith thas cuntimet, ex ploded by alowing hot metals, ly bullets fired into it and otherwise by deliberate arthficial fignition. The dis. advantage urged againet it in itr practical application is, that when the temperature fallis liwhu $6^{\circ} \mathrm{C}$.. It harilene, and that then. particularly whell lomse cartridges of a charge is mut uxploded, limt a purtion remeinu alte gether notamaged, or is hown out anespluted. Th caneu of this stifleving is of comose the to the matura crystallization of the nitru-clycerime. Litheifocteur, the invention of Prof. Engels, is nn Inymovemiont umb dynamite, and terives ith advantuges from the dimuth thon of the proportion of siltefoms meal as urelt an of the nitro-glycerine, the falance bethig male gend ly othry ingredients of an explowive nature, the d-tails of Which conntitute the merret of its manmfaciure, for peither nl.rond sur in this comutry link it fet lom

 as also by firing shells fitter widh it from camma, whit exploded ondy when. Neither
 formed ure tousparent, und uily detmetablo liy the shell. They nre not pleasant tio mbate largely, th headacho wouhl follow; but as dilutind in the ujen an
 als:antages of tithofractepr ower the olld thasting gunpowder are very remarkable, and, although the latter for certain work will still maintain it grount, the furBeailes ita more energetic antion mad the important saving of time, lator, and fenls which is rflected by it o nse, its alsantages are especiatly notable ill its apphas less amount of danger incurred in transpurt trom plat tu place, and in charging the blasting-holes, Lith fractent possesses this advantage among others over
dynamite, that it can be exploded at $x$ lower tompura dvanaite, that it can be exploded at a lowir t-mperat
time ; and it is stated that it can lus fired lyan energeti ture; and it is stated that it can lus fired by an energeti detonator even at the temperature of - 12.50 C., whil
dyanmite ceases to explode at $+5^{\circ}$ to $6^{\circ} \mathrm{C}$. Fur mimme purposes the great desidentum is the quantity and ua
 expense If, then, these can be dimmislied in mumber as well as in dimensions by the gienter power of the Dlasting material, the savims in the quarrying aining "peration becomes fir more importint that the differnace in cost between the clusurer and les effective hastiag-powier and the bitrongormme com pands, althongh that difference in price may he con-
siderable pound for ponad. One may tenumlly an sidme, necording to the statistics sot far attulatile, that $\mathbf{1} \mathrm{Hh}$. of lithofracteur acts as powerfully us 6 lla . to Sbs, of hasting-phwder; but no exact compurisons for
 The difference it the price of the powiler is also mor than equalled in the satimg of fosented that this path whone dealncts a thirs from the expunse which the nanutal labor regnired for blasting-puwhler entalls. Fin the econsmical workmy with lithofactenr or dyamm most cosses it is not required to exceed from 36 in , tu) most in depth, while for breadth $11 / 2$ in, at most is suffi cient. The harder and stronger the riok, the weter minst the hole be. One of the great values of fithefracteur is it. power of masting iutu perfectly tlat faces in the first experiments mule in Englaui, is 18i1, in in the furst experiments mate of Natman and the Breidd $n$. One iustance of absulately larizontal hom ing into the fiir face of the dense linestone punery cliff at the former place, and one example of perfectly vertical boring into a flon of a tongh hommgenems greenstone rack at the latter, jutting out at right angles from the towering cliff fice of the latter tuble hath $1,20 \mathrm{ft}$. and over in whloroken height, will sufthee show the really nseful as well as powerdul earrigy whe this explosive is afte to exert in the commerchal work of quarrying. in the experiment at Aantmawr, chmp havis could drive them into a leed of sulitl rack 10 ft mands could atrive ther at fismine a continuons part of the lower purtion of the cliff 150 ft , in lumight, and near to a salient angle where the quarry workinus nut at a right angle. The line of leat rexistance of the first way from this first charge was placed the setont charge ad at $t \mathrm{ft} .8$ in. Yet again wis the thirit coarge. The fures were 3 ft .4 in , in depth. and $1 / \frac{2}{2}$ in diameter. Thie thickness of the bed of rock was is in. Each hole wits Water. It need scarcely be said that gmpurwter in such Jnoles wonld merely shoot its solid tamping ont like a int the rock. The middle or No. 2 clarge was first fired, and blew ont a cavern of triangular f.rm 6 in aloug each of its tomaling litus, and the dept 6 in . ahong each of its bonnding litus, mond the diphed wats slivered for a distance of 6 ft . on eath side, anm sliaken nud fissured over a length of 20 ft . From such a headius, farther convenieut workings were at ance practicable. The other two shots werr uta similarly effected. We thus set the superior actwon of the violent mitro-glycirioe fletumation over the slower harming explosions of Enapowiter. To give fuw an ex smple of forsr-work, in which knapowtir womit emady from a light in the Breidden Areuntine cliff, autl murn frota a light ins the Bredden greeptine chif, ant it, it $J$ Jugth. $\overline{\mathrm{ft}} \mathrm{ft}$. in width, t:urering to a puint, with its surtise dipping from alsunt 5 ft . extreme height at its junctitio with the cliff to the level of the flow at the to charge, a little over 1 lb . of lithofractenr, heing put minwaty on the slope in the position of the mean hepifh
of 2 ft . The bormolala w:ts $3 \mathrm{ft}, 6 \mathrm{in}$ dpep und $11 / \mathrm{in}$ in diameter. When the charee was fired, splinters uf stem were sent into the air tuore than 801 ft , up; and th mass of the fluor shattered conpletely over an area of whin eight consulerable fissures were riven int:" the

 Cobalt B,,sc. The action or phosploruns on copperaboy is due cheefly to its reducing qualaties, by which the
oxygen, absorbed by the molto
thetal, is removed, or oxygen, absorbed formed are eliminated Silicium $B$,., in
the oxides thus
thisalloy phosphorous is replaced by a silicious metalloid. It is highly recommanded for telegraph wires, heing, it is claimed, only one-tenth the weight, of equal strength and with mach greater conducting power than the ordinary wire. Manganese $B$. was introduced in 1876 , it is prepared by mixing a amall proportion of Ferro-mangrame of the alloys, of which there are several grades. swelta-methl was introduced in 2883 ; this metal is not
Dell capable of welding, but can be brazed, and also, by only cast in B. or brass. Phosphor-dead bronze, introduced in 1881, is claimed to be especially adapted for purposes where metal is subjected to constant wear or
friction. Silveroid add Coball-bronse are of more recent introduction, and composed of an alloy of copper and nickel, with zinc, tio, or lead. Aluminum-B. is well adapted for table cotlery and other table artictes, in place of silver and silver-plated ware, for metallic, fit tings, screw propellers, ac., where a non-oxidiziog,
bright surface, with strength, is reqnired. Brook'field, in Iowa, a twp, of Worth co

viding it as it were into so many mumbers or periods. The C. takes pluce when the yarte fall ur terminute on a note or chord naturully experted hy the ear, just as a period cleses the sense in the paragrapis of a dis course. A cadence is either perfret or imperfect. Tho former when it consists of two notes bang ofer each the larmony of the fifth preceding that of the key-note; and it is called perfect. becanee it satisfles the ear more than the intter. The latter imperfect; that in, when the key-note with its harmony precedes that of the fifth without its added seventh. A cadence is said to be broken, or interrupted, when the lises raizes a major or minor second, inetead of falling a fifth.
Cradency, To regulate by musical measure
C'adene', $n$. [Fr. cadine.] A kind of inferior Turlsey carpet. ${ }^{\text {chatent, } a \text {. Fanling. (s, }) ~}$
('aden'za, $n$. [It.] (Mus.) This term, nlthough etymologically the same as cadence, is used to deoote a passage in a concerto, introdncod at the pleasure of a player,
to exhibit his skill of performance or composition, fmto exhibit his skill of performance or composition, im-
mediately before the end of a movement.
Cad'er Id'ris. [W, "Chair of ldrie," a repnted giont.] A mountain of Euglsid, in Merionethahire, 5 m . from Dulgelly, consisting of an immense ridge of broken precipices, 10 m . loog, and 1 to 3 m . bruad, tho highent peaks reaching ${ }^{2}, 914$ feet above the sea. The view from

Calciser, $n$. The person. or thing, that calcines.
Cai'eite, $n$. [Lat cala, lime.] (Min.) A general term under which nre comprised the different varieties of carbonate of lime.
Calcitra'tioas, n. The act of kicking.
Caleium1, (kal'se-um,) n. (Chem.) A metal of the 2d group, hanving for its amploghes bsrium, strontium, and maguexum. It is one of the most abualan of the crnst of
natore, forming a very large portion of the matore, forming a very large portion of the earth. It occurs in miture in combination with floorine as flnor-apar, with oxygen and cartonic acid as chalk, limestone, and marble, and with oxygen and sulphuric acid as gypsun, which is hydrated sul
phate of lime. C. Was first obtuined by Sir Ilumphrey phate of lime C. Was first obtuined by Sir llumphrey
Davy by electrolysis, in 1808 ; but little was known iif its properties uncil Dr. Matthiessen formed it by the electrulytic deconuposition of a mixtare of the chlorides of calcium nad strontiom. It is a ight-yelnw meta, of the color of gold alloyed with seiver; it is rather hatlealle. than lead. It meits at a red heat, nad is very mationaist It tarnishes in a day or two even in dry air, ant is monst
air it becomes slowly oxidized. it burns with a brilair it becomes shite light when heated in air, chlorioes, or the vapors of iodine, bromine, and sulphor, and rapidly docomposes eved at ordinary temperitures. It has also been oltained by MM. Lies-Bondart and Jobin by ncting on iodide of calcium with sodiman. No other metal in
so largeiy cmployed in a state of combination as $C$, for its oxute, lume (C.th), occuping ammag basus much the same position as that which sulpharic acid holds among the nelds, and is usod, diristly or indirectly, in must of
the arts and munufictures. The sp . gr. of C . is 1.35 ; the arts and munutictures. Th8 Ep. Gr. of C. is 1.05 :
equivalent 20 ; symbol Cat- Soe Lusz. Chlorile of C. may be obtained from the residne remaining is the retort nfter the preparation of annonia,
by ndding to it a slight excess of liydrodnloric acid and evayorsting. On cooling, the solution deposits crystalcos aining six atoms of water of crystallization. Thest crystals, which are six-sided prisns, are highly deliques-
cent. By fusing at a heat not excecding :9920 Fahr., four equivalents of water are expulicd, and the remainimp white prons mass is extremely usefal in the faliomtory for dryiog gases. Further fusion expuls the whole of the
water. Anhydrone chluride of calcinm, on lieitg mised water. Anhydrons chluride of calcinh,
with water, kives riso to a consideralie elevation of temperaturn: while tlue cryatallized or hydrated sult, mi xed Fahr. Cof $1^{\prime}$ Farm. CaCl, frim its delignescent prop. orties, is recommended for watering the streets of cities.

Fluoride of (: occurs somewhat abundantly in the mineral kingimm as llam-spar, which is generally aso-
ciated with the ores of tiu, lrad, copper, ami zinc. It is fonnd in crystals, the primitive form of which is the cube. They are genurally yellow or purple, and sometimed pale green, or even colorinss. On being heated. they decnsuitate violently, and emit a peculiar blaishgreen phosphoreacent light, which is probably due to
electricity. Flnoride of calcium is sparingly solvthle in electricity. Flnoride of calcium is sparingly solutito in
water. It is eolnhbe to some uxtont in nitric and hywater. It is eolnhle to some "xtont in nitric and hy-
drochioric acids, from which mamonis precipitates it bnchangud. Sulphurte wein dreompusers it, formiag sulphate of lime with the evolutiun of hydroftuoric neid. parpose. It is niso employed us a hax io copper-smett ing. Fhrm. CaE.

Cat entiar, h. Lat. culenduraum, from colenda, tho first day of the old Romanamonth, From caln, Qr. kuleü, to call Sce Calesids. (chrom.) A distribution or division of tian into periods adapted to the purposes of civil lite; alad table or register of such disisions, exhibiting the ord in which the ecasone, gonthes, festivals, and holiday bucceed ebch other in the year. The most remarkabli Jows was a lonar one, beine composed of yele of the vided into 12 monthe, which had aiternntely 29 and 30 days. In order to make this lunar year accord with thu solar year, the Heorews supplied, seven times in ninu teen years, an intercalary month of 29 days. Each month was divided into periols of 7 days, or weeks, the Suturday being celebrated uoder the onme of Sabbath, - 2. The C. of the Gieeks, whose year wis likewise tunar and composed of 12 months, contaioing alternately 24
and 30 davs. To arcommodate this year to the sular and 30 days. To accommodate this year to the solar one, the Greens maded every two vears a suplementary monti. Ench monel hian Rommlus, contained only 10 monthe, or 304 days. A eder Numal however the y war was extunded to T. monther 355 days: but, although nomiailly thas defived, the $C$ did not in reality fix anything nore preribe than the colmmencement of tho months and seasuns: and through the ignorabce or aegligence of the priests, thie utmust derangenseut sobeequently arose. To obviate this confusion, Juhus Cossar, in 40 B C., effected a res form, by the introduction of the Julian C., in which the
length of the solar year was fixed at 365 days, to which length of the solar year was fixed at 365 days, to which
was ndided, every four years, a day called bisseatile. This C. wass adopted not oaly by the Romans, but also by all the modern nations, and Fromoed in wse until the intruduction of the $C$. of Gregory Nill. The Romaty year had 12 months, each beiag divided into unequal -4. The Grogorian C. This mode of distributing time Was the result of the reform inangurated by Gregory XIII. (See bisstx tile.) It came into operation in U.t. 1..82. The Grecks and Russians have refused to adept the Gregorian C, retaining the old style or Julian C:
Hence it is necessary to dedue t 12 days from the new Hence it is aecessary to deduct 12 days from the new
style, in order to make it asree with the old. -5 . The style, in order to make it asrea with the old. - 5 . The
Eeclesitasticnl (: The adaptation of the cavil to the solar year is attented with oo difficulty; liut the church (: onsily sathsficd. The early Christians borrowel tion of their ritual from the Jows. The Juwish por was loni-solar; that is to s.iy, depended on the monn as well as ou the sun. Ester, the priucip.l Christian festival, in imitation of the Juwish passover, was celebratud ion, und conse of the disputations, eoon arose as to thu proper day on which the celebration should be held. In order to put an eat to an unsecmly coutention, the
Ceunail of Nice latil down a specific rule, and orderet that Euster should always be culchratedo on the Sunday which immedintely follows the full moon that happens opoo, or dext atter, the day of the rurual equinox. In particular year, it isneceswary to reconcile thrue periols namely, the weok the luar month and tholuar yer To find the day of the week on which any given day of the yetr falls it is pecessary to know on what day of the week the year began. In the Julian C. this w.us e.sily found by means of a short period or cycle of 22 years, after which the year begins with the enme day of
the week. In the Gregorian ©: thisurder is iuterrupted the week. In the Gregorian C: this urder is interrupted
by the omissin of the iotercalation in tbe last year of the by the amissina of the intercalation in tbe last year of the
centiry. The conaectinn of the lunar month with the ceatiry. The congectinn of the linar month with the solar year is an ancient problem for the resolntion of
which the Grepss invented cycles and periods, which re mained in ust with some modifications till the time of the Gregurian refirmation. Theauthor of the Gregorian Alnysind Lilius, emplnyed for the same purpose a het of numatro callra parats, - 6. Now the C. was attenptel to be introduced in Fratno during the period of the firot revolution. This wasi
adopted by a fecree of the Natlonsl Conrentlon of Oet 1793. The yeur wis thercin thivided into 12 montho, if

 Calendir rinl, $a$. Pertaining, or relating, to the Calen'dler, n. $\quad$ O. Fr. calendrer; Sp. calratur, to heat, cloths, mull make themsumenth and glosiny ; one who follows tho businens of culendering.
-One of a Dervibil sect of Oriental cuntries, called aftar -v. a. To piress mader or over a heated ruller, of a hollow ron cylinder filled with hot comls; to press betwem rollers for the purpuse of amaing smonth, glosey, und C'al'endlering, per, and other miticles to a machine, which, when so propared, are catendered, litumblly meaning hot-pressed; hy
pissiag betwen cylindern or rollers, thuy megniren passiog between cylindern or rollers, they negnirea hesed they are twisted aod taogled, so that they wuald not pass smooth-

in a vertica!
Fig. 47.
upright frame, the rollers being pressed forcibly together by lewer-power. The lower rollers are generally Io pas ing lucte creases: the upper rollers are smonth. stretched, whes it is wound ppon a roller, ready to be atarched. The cylindere were formerly made of wood, Lot they are now oade of paper and cat-iron, or cop-
per : a cylinder of paper wos king abainst one of iron, at per : a cylindur of paper woaking ugainst oncof iron, at ticity with the extraurdiuary hardnes they pussebs. These cylinderx are made of diacs, or polateey pussess. pastebemard, with a bole in the centre to ruceive or thick pais, adol others near the circumferetice throbits wisith long tron tholts, with nuts and sctews at vither end, aro pussed. Iron plates are added at the ends of this cylinder of pastelrourd diecs, and the whole is tightly compressed ly the action of the screws. The surface of the roll-r is ronl-red true by turning it in a hathe. The iron cylinders which are mad in colnjuction uith those of
jutper nre hollow, and heated by the introduction of inper are hollow, hat heated by the introduction of flour, fermented and strained to suparate the bram: a little indigo is mded to give a blue tint, and the liquor thickened with purcelatn clay, or calcined gypsum. to give apparent strenceth and thickiess to the cloth, and make it more uttanctive to the purchamer. The starch is lail on ty in stiff-oing mangle; the eloth firet jase ink under a roller into a trough contuhing the starchliqnor, hecomes filled with starch, nud then carried upWerds, passes butween rollers of brise und wood, tightly fitting Mgnitst each other, by which the superfloons starch is prenecd ont, and falls down into the trougi below. The cloth is then drived ly being puesed over tim or cupper cylinders, hated by steam. Muslins are nervly stretchech on wing frimes to dry. The finish for closs (i) tibe muterinl. In thas couge thic cioth nuwt firt bos domped. which is done by pasuing it over a cyin der, while a lirnsh is at the same time gcittering fine sprays of water un the stuff. It is then phased teetween
the rollers of the colurs, and gets an sillsy liutre. Cou
per-emboseed rollers are occasionally used for producing per-mboseed rollers are occasionally used for proncing
figures nol patterns oo veivet goods. After the cloth
his received its final slose, it is sumonthly folded ou a his recelved its final gloss, it is smonthly folded on a cleas board, and taken to be measured preparatury for iog up gools. Muslin is made np in book-folite, in pieces of $2+$ yarids: usally two half pleces are male up in one book. Cumbrics and linens are in pieces $3 f$ inches wide, had si/k yirns loug, foltert up smand and tighthy

Its area is mountainons and the Sierri Nevadn extenits,
woder differeot names, and with different altitneles, from tbe 8. extreonity of the peninsuls to Aluska. The lenjeth of this chain, and its cob-tifuedts, embrace a distance of nearly 300 m . in lenath throngh the State, and 300 in width 14,000 feet aboves siallovel). Spanal Peak, Lassen's luatte Milot Paak, Monnts Tyadall, Wbituey, Dana, Lyell, \&o These vary in altitude front 10,100 to 15,000 focet, and priecinally take a line rumuibr N. $31^{\circ} \mathrm{W}$. The Sierra Nevada chain is remarkahle for its paralleli-mand prox imity to the sen, its great elevation, and its mumerous volcanic peaks, stretching far above the line of perpetual
enow. Its distance from the coast varies frod 150 to 200 Di., so that the area of this portion of the country ex ceeds $100,000 \mathrm{sq} . \mathrm{m}$. The great monntisn wall of this Sierra intercepts the warm winds charged with vapar which sweep across the Pacific Gcean, precipitates then
accnaulated nanisture in fertilizing rains and snows npun its westere flank, and leaves coll and dry winds npun its westere flath, and leaves coll and ury wind-
to pass on to the E. Hence, the characternstic difference of the two regions, - mildoess, fertility, and a smperl of the two regons, - midocsa, fertinty, And a supert neas and cold on the other. Betwerll the late of $34^{\circ}$ and $41^{\circ}$, a range of lower mount ins runs close along the shore, the culminating point of which, Dinte Dabhto. close to the Bay of san Frantisen, attains to the heizht of $3,67+$ feet. The valley between this const chain anh the grand barrier of the Sierra Nevacla comprises the valleys of the Sacramedto and Sad Joaquid. 500 m . lodg.
and liy far tho most valnable portion of f: The W and hy far tho most vanable portion of it is a long wide, timbered. grassy slope, with intervals of mratle ham, copionsly waterel with mumerous and hohl streams and without the cold which its aameand altitude might imply. It is from to to 70 m . in width from the summit of the mountain to the termination of the font-hills un the edge of the valleys bulow. Timber rinks first emong the prodnctsof this slope, the whole being heavily
wooded, first with oaks, which predmminate to about half the elevation of the mountain, and then with pincs, cypresses, and cedars, the pines in majority, and bence
called the Pine Region as thit lielow iscalled the O.t. R called the Pine Region. as that helow is called the Ork R Rr gion, though inixed with other trees. The highest sumcovered with snow ta slieltered places, all the year romil. The cypress, piacs, and cedar are lectween 100 with clean, selid stetns, (ir.ask grows ion almost all p.irts of the slope, except tuwards the highest sumanits, and is fresh and green all the year ruund, bijng neither killed by cold in whiter, nor dried by dronsht in summer. The foot-hills of the slope are snfficiently fortile and kiadly to admit of good settlemedts, while valleys,
coves, lrearhes, and mealows of mathle land are fromd coves, beaches, and meatuws of mathe land are fombu them even considerable rivprs, whinh flow down the moantain she, matke hor The climate, in the fower far of the slope, is that of constaot spring. That inrtiou of the cuast-line letween Bodega B iy oe the S.and Mendociboco. on the $\mathbf{N}$., has, with s meexcentious, in ble.k and erid sppearance. The Sllidas aod Rasian River valleys, treuding E. and W., are highly fertile, and prodace
the rineat cereals, fruito, and vegetables raised on this part of the coast. Asmong the inland valleys are those of Nupa, Sonoma, Petaluma, Amador, Ean 1 kamon, d That division of the Munte Diable range called the e: tra Cista Hills, presents many lofty peaks, the most el high. - Boys, Rivers, Lakes, dc. The principal festure in the comntry between the Sierri Xevaliand the ocman is the great bay or iulet of the sea calleti Nur Frincisco It has a narrow entrance, the famons "Gublen Gate, (Fig. 479, abt. a mile in width, is $37^{\circ} 4 \vee^{\prime} \mathrm{X}$. These mines sextend from N. to 8 . linear distance of slout $250 \mathrm{mi}:$ and the amount of terr tory that they occupy is prohmbly net less than 6,000 g. m . The profitalle mimmg of the depleits, in these as it middle placers, bas required the emenernetion of the sumd and urame. The the wablang of the gold trom be simp what ene. The varictics or miningare: Pluce in P'enmeylvania, arlito bomg triven into the hills, und in Penmeyvamia, aits belog eirven hito the hills, und Alpusit existo: Hydraulic miminy, whete a brosd, ajpet ditch is carried through the bills, Holl the sides washed duwn by directing a juwerful otream of water on the hirer mining, in whin, whed the rivets are low, th streams are diverted from their coorsic by meane of dumes, tail-races, \&c.. and the beds of the rivers thas xposed and their bands washed for gold - this cin only
 fack of the earth in sue djuceut streams after being bed by the miners: lastly Quartz mo mag which ruquires a monejderable in fottment of eapital, bot is proftulate. Io this descrit tion of mieing the gold-bearing gaartz is crushed by puerfol stamps, io mins drivell liy xteAm, water, mole power, to the fincbess of flonr, avd then the gold theen op by nerans of quicksiver by the u*val wush ang process. The total value of gold prodnced is $C$ from the discovery of the alines, in May 1848, to Jude 30, 1881, and deposited at the U. S. Avery offices, was yielded by $C$. in E1 Dorado Mavipesa SaDin Darları Sunta cos.; and most of the guld euntnins a considerable portion of silver. Many millions' worth have thus heen ob tnined sibce the pertiod of the gold discovery. Copper strongly inapregnated with gold and silver, is found io Placer, Shasta, El Dorado, and other connties, Quick silver in the form of cinoabar is largely produced at the New Almaden, Gadalemle, Aurors, aodothermines. Iron, in large quadtitips and varions forms, is foudd is all the coast range ; io Macer co., in a condition ap preachiog to nstive iron in purity, and in Mariposaco. in the form of hydrate. Snlphate of irod in large in the same region. The miniog of qpicksilver, copper, frob, \&e, has also beee rery profitable. Platinnm is alnoost as widely dispersed thronch the State as gold, though io smallet quantities: osminm and iridium are closely assocrated with it. Tm is nlso fonnd in several parts of the state, and will probally cre long be mised with advantage. Chrominm, Eypsum, nickei, antimony, bismuth, mipher, lead, salt, naltuetre, borax. cosal of good quality, and in harge quantitses, narbles of extraordinary beanty, anmostit momite, buhrstode, lime de., are the other principul mineral promects of the the statements of the eurlient visiturs of the colntry that gold had tieen found or was known to exist in of but theso statements hatl either liecon forgotten or made no impression till late in May, IS4s, wheu the abriferaus deporits acen discorered, that nttricted so moch attention, and had such wond.r(n) renults. They were found on the S. fork of the Ameriman Miver. a tributary of the Sacramento, at a placu now called Coloma. The newe of the discovery, and of the nophralleled richoesd of the dejosita, spreud with extraordinary rapidity ; and before
 to the spht, and their enterprise bud been rewarded by钓,000,000. Duriog the acasun of Is 19 , cmicrants of all

CALI

Dew State was admitted into the Union in 1850 , and
Sacranento drelared to the ito capital. By the terms of Sacrannento declared to be ite capital. By the terms of
the State Constitution, the legishture of f : consists of the Ecnate and asemahly, aud cooveneg anboally at Sucramento on the first Mondisy in January. The senate districis. and the term of office is two years. The lieat. governor is ex-officio president of the senate. The assembly is compused of 80 menters, elected annually The pay of the legislative menibers is, for the first 90 daye of the session, S10 per diem, and for the remainde of the session \$ per day, and milage at the rate of \$t for every 20 miles of travel from their residence ly the nearest anal-route to for capial sesoions, to commence anenome-nte provide for bienumal sesolons, to eommenc on tho frot Monday in Dec Members of the asemply - Railroads, Cunfle, dry C, hal in 188t, 2,828 miles of railrosid, with capital stock of $\$ 124,102,5 \times 2$; fuoded debt, $\$ 194,503,153$; met funded, $\$ 7,157,861$; making a total of \& $23,763,596$. Cost of eqnipmeut, $8259,360,0+7$; gross earning $\varsigma, \$ 22,831,218$; net earningx, $£ 8,418,395$; aod she is still progressing rapidy in further development in this direction.-Mining. Tine dibris arising from the ef fect of bydraplic mining has produced cause for lerious alarm in this State. It con-ists in practically "slickens" and sund. The territory most seriously ffected thar far has luen on the Yuba, Americin sud Bear rivers; the loss thereby to agricultural property is catimated hy tha. State Engincer as reachiug $\$ 6,000,000$ in 1880 . This valuation is unly what may be called the direct damage. Millions of property in the valley of the sacramento are threatened with cer taid destraction. This area alono covers nearly 1500 sq. miles of fertile territury, and the estimated value of this land. together with other similarly situated, is placed at the large sum of $\$ 60,000,000$; a total certuinily wortby the inme miny of the rivera is water-way, it is a query then for the state to solve, if the destrnction caused by the manner hitherto adopted in this process of miniog minnner hitherto adopted in this process of miniag The annual out-put of the bydraulic mines is pliced at uhout $\$ 14,000,0 \% 10$. Canals constructed by prisate compranies for purpexes of mining and oavigaton are of extraordinary extent. Steamera make the passage fron N.w York and New Orleans to Aspinwall, respectively,
in ubout 7 and 4 day; and nllowing three days for the in ubout 7 and $\frac{1}{4}$ days; and ullowing three days for the
conveyance of freigit neross the linthmus, und 10 day conveyance of fredgit neross the voyage from Pamama to Sun Francisco, the pasage from New York to the latter is made in 20 , and from
 maibed aiongits sloores, prolonging bis voyage to the 4xth dogree of Lat. From this circumetance the name New Alhion was sometimes formerly given to the conntry $\mathbf{N}$. of San frumisoo. It was nut colonized hy the Spuninads till lics. The latter founded establishments iti varims parts of the comotry maler tho mancs of foresi dens and Afessions; the former being military pists, and

perurs, sun of (iernuasicus the th of the Romsn em ceived his surname from culigo, o kind of shoe which was wort ly the common soldiers, and which be frequestly wore himself in order to gain their affections. C: early devoted himself to cobrting the favor of Tiberius, and so fur succeeded ia ingratiatiog himself with the emperor, that be was soon promoted to respunsible othices of state. The nucertainty of succession whicb followed the death of Tiberins, who was pint to death probalily by one or joyed, affurded hims a larorable opportunity of succeeding to the bovereign power (A. D. 3in). His povernment began well, and with eymptons of ereat elemuncy; bat his conduct was soon clunged. He became addicted to intempramee and cruelty, and bis extravagance knew no bounds. He took upon himself the highest titles of bonor, and even had temples erected and sacrifices offered to him as a god. It seems probable that his grandmother Autonia diel by his orders. Accurding to Dion Cassius, he frequently visited the prisons in perzon, aud ordered all the cuptives, wutried, puilty or pot,
to he thrown to wild leasots. Sumetimes he nonld order a Dumber of the spectators to be seized aud tirown among them, after having bud thoir tongues cut ont that their cries mieht nut intarrept his ferocious de light. Old age and weakness rather attracted than light. Old age and weakness rither attracted thaa had been the areans of his elevation, und his wife with bim. A favorite borse, Incitotus, he fed with gilt oat sad delicious wipes; be appointed him a grent number of attendants, and treated bim with the most absord at teations. He erected a bridge over the sea from Bait to Pateoli, on which he rode along, enjoying the sight of ausilera of pereons drowning nuder bis order. He made great preparations for a war agaiust the fermans, without having seen winclo epeuy. He invadud and plundered Gaul, and banished bis sisters Aprippina und Lavia. It is said that $C$. Insd a design to destroy the works of Honaer, Virgil, and Livy. After a reibn of less than 4 years, and in the 2 ath yenr of hisuge, he wat mordered by a band of conspiraturs, headed ly Cessius Cliserea a tribune, A.D. 41 . The character of this emperor is pretty accurately given by Seneca (De Iró), when he saye that nature secms to have inteaded to show in the instance of $C$. how much harin can le done by the 'n'lin. $n$. delineate dintant shjects, or trace the ovtlives of landdelineate dixtant mivects,
scapes, \&c.. with perfect accuracy. It consiots of a quadrangular glass prism, quadrangulir ghas prism,
$a, h_{1} c, d$, liy means of
which rays of light are bent, ly two reflections, into a path at right anglea to their previous direction. A ray of light proceeding
from o entura the face of the priben at $a$, and con-
 straight line till it meets the adjacent side of the prism
 side of the frism, and is in like munner reflected in the side of the 1 rism, and is in like manner reflected in the
direction $\mathbf{E}$. The eye boing placed at $\mathbf{E}$, fees the image of the olject on the surface of the prism at $c$. und refers it to 1 , on a plane $\mathbf{M} \mathbf{N}$, which oray he cosered nith a sheet of white paper. The puint of a pencil can also be seen on the paper, nnd thas the mocurnte onthine of the ohjeet nay bue traced. It in casy to see frum thin
the proper form whinh the cry ctal shand have By the the preper form which the cryztal slowhd have By the
laws of optios, the size of the picturewill leme the sanue laws of opties. the size of thr picturewill herr the same
rcmation to the oljuct delibented, that tha dintunce of romation to the oljuct deminemed,
the eye from the paper benrs to the dintance of the objuct. Hence, is order to increase or stimmieh the stae of the picture, the prism is monnted in a lows frome, supporten by lirass tulies capuble of lemp lempthened or shortenell at pieasnre. A thin brion plate, nflixed th the upper surface of the priom, aud havimg a small bole in it for the oliserver toleck throngh, kerps the "ge in its proper flace, and procures steadinuse of vision. A plate, for the purpase of magnitrime the image - or a concave lens placed befure the prism at a will adapt it to shurt-wighted perrons. The instrament is extremely convenient na acconnt of ite portability. There are lucula, the best of which is that contrived by signor Amiri of Mostena, in which a triangular prian is combinell with a plate of glass having parailel surfaces. The eamera lucida luas leens nust snccusnfully enuplyyed ly the microsepe. The instriment nacel for this purpose resembtres that commonly applizal to lamiseapre-drawing, but is providell witha bitting, whilh whapts it to the
eyn-piece of the nierosenpe. The stod disc of Simanes-
ing is used by many microscopic dranghtsmen instend of the camera. This contrivance is a little disc of pulsthed steel, placed at an anple of $45^{\circ}$ with the eye-pucce, reflect it upwaris opon the retina of the observer. The disc is smaller than the uperture of the pupil, and the drawiog-pencil can at the same time lre seen very well as it tracea the image apparently thrown down on the
paper beneath. Whep either the cancra or steel disc is paper beneath. Whep either the cabacra or steel disc is used, the body of the micruscope must, it possible, be
'anased horizunataly
Casa'era@bseara, $n$., (obs-ku'ra.) (Lat., dark chamber.] (Optics.) An apparatus by which the images of
external objects are thrown on a white surface, snd external objects are throwned io a vivid maner in their proper colore, shapes, \&c. Hence the apparatus nay bo uscd for the purposes of delioeation, us well as the canaera lucida; chicfly used for the production of images or pictures upon surlaces sensitive to light in the art of photogratphy, and cameras of great optical jerfection are now
constructed for this purgese. The comano camera obcotstructed for this purgsese. The common camera obscurt is thms constructed: Throngh a convex leas, or
smatl circular bole at C , the tight is admitted into a suatl circular bole at C , the light in admitted into a

(anmoens, Lutz DE, (kaniorms,) the greatest poet of Portugal, b. at Jishoti abrut 1524 . After hiving stud
ied at Coimbra, he returned to Libloun, fell in love with a lady of honor, was basished by royal anthority to santarem, joined the expedition of Juhn 111. against Moroceo, and lost his right eye in a naval enwagement with the Moors in the Straits of Gibraltar. On lus return to Lisbon, his bravery as a soldier was 110 more honored than hix genins as a poet. Dikippointed in all his hopes he determined to leave forever his native laud, aud sailed for Judia, 1553. Offeorled by centitia abrases ot the Por tuguese antharities in Iodia, $C$ veotured to expose them India." if which he treated even the viceroy with ridi enle. For this offence the puet was luaished, 1556, to Marao, where he lived sevent years, und was engaged in writiag Os Lusiades. In 1561 he was recalled from his tanishment. Unhappily, is returning to Gora, he suffered yhipwreck, und lost all his property, excejtion his epic poens. Aiter other wauderings and misortunes, C. tork ship for listion, where he arrixed in 1569. In dedicated The Lusiad to the young kiag. shmstim, wh bestowed on $C$. a very small pension, and permission to remain at the court of Liston. Even this small pittane was takell away after the death of selositian, aud $C$. wa begred in the streuts of Lisbon for the suphert of the remt epic poet of Purtumal ('s lyric poetic, written furing this tine of destitution contuin uany pathetic amentations. Ile died obscurely in the hospital at LisHon 1580. The Lusiad (Os Lusiadus "the Lusitanians,") celelarates the chier events in the history of Portural Among the most famons passiges are the tragical story of luez de Castro, and the ayparition of the giant Ada mastor, who appears as the Spirit of the Storm to Vasco de Gama, when crossing the Cape. The versification of The Ltisiad is extremely charming. Patriotic sunti ments persade the whole wurk. Besides his epic poem C wrote sonaets, odes, elegies, eclognes, rpigams, si L. wis L. Was pmbs in Paris (18-3). Tas puem bas hern transla F Duf, Listom and thilada issu) Nop in Engisti, by R . be tranklated lamp, and not candle. For example, the seven-branched candlestick is ordered to have sevet lamps made for it, and Aaron is directed to thee olive-til
an the tual thereof. Torches ure mentioned in varions abcient writings, snd from them, no doubt, candles were gradually devcloped. Plioy, however, describea a can dle made of brittle rislies, which clearly corresponds to our modern rush-light. In the liter days of the Romans, the Middle fares, candles of the same math-rial wore pante, weghing as moch us 50 lbs . ; and the Britons and Angio-Situons aned ormamented tapers in their proces sjuns. The uss made of candles by King Alfred for borolugical purpuses is tuo well known to need further allusina. Givod old Gilbert White of Silluorne deserilse rusli-lights is being biade aud used by the cottagets it his tume. The mannfumbe of C. proyressed but little until tha begining of the present century, when candlemaking attained rapidy its actmal pertection. (Maraf) C. are matue of either pax, spermaceti, steamme, or tanow, or bome compound or mornicntion of these; but of whatever they may be made, they are formed either by dappiog or casting, and henco the quatitity of wicks of epun cotton are preparal by a machime, and donbled so as to form it loap at the top, through which a stick is passed. A number of wicks ure arranged in a line on cach stick, and soveral stick placed side by side on a frame, which is attached to one chut of a balauce-beam (called by the workmen the "horse's heud"), with weights at the other end, according to the weight of the candes to be made. The frame, with the wicks upon it. is stispeoded over a cistern of melted tallow (kept warm by a suall fire or fluc), into Whind it is lowered, so that the wicks dip into the talof talluw is formed on the wicks, which are then placed aside to cool, while otheres are served in the same way and so on over and over again, till esch frame weizhenourh to exactly caraterpoise the weight at the other end of the beam. Mould caudles are made by pouring melted tallow into a wooden trongh, in the trottom of which pewter moulds of the size of the candles required are fixed io such a way that they open into the tronghs by the ends, which correspond to the bortums of the candles to be cast in them. The other end of the mould is lirunght to $\pi$ point, with a small holo in it, through Which the wick is passed and Castened tha stick running ulong the moulds: and as the moulds are placed in
twolines, two sticks aresufficient for the trough. Melted tallow, or spermaceti is poured inte the trough sud when cold, the spperfluous quantity is removed, nind the candles drawn ont of the swoulds. Wiax eundles are made by pouring melted wax dowo the wick till sufficient has adhered to it, then rolling the caudle on a marble slab till it is even, and nfterwards polishing with a eloth. A tallow C, to be good, munt be half sheep's and half ballock's tallow, for hog's tallow makes the candle gutter, and always gives an offensive smell, with a thick, brack smoke.

caninas, from caria, a deng. Ilaving the properties or ynatitus of a dog; laving Clenine uppetite. A diseaze comeny
 which, like that of a doge or wolf, could never boe mp pesised. - Cunine teeth. The dag- or eyenterth. Four of the fonr incisurs. In man, thongh extremely use ful, these teeth are, in a meskure , only rudinentary white in the dog and lower animals they are fally dorelopend, and known us the fungs. The cinine teeth ale now generally catled the caspuidoti, or teeth with one
point. For the fnnction and growth of this set of teeth, point. For the finnetinu and growth of this set of teeth 'an'ins, $n$. A lenting with a stick or cane.

'a'mls, n.: pl. Cixes. Lat ( Zionl.) A genus of the Cavida inclulag the dug, wolf, and jackal. Its prineipul charac turs are, six incisorn and two canines ith ench jaw, six mohare on each side of the upper jaw, and seven molats on eacla side of the lower jaw, tuaking in all forty-two tecth, of which there are wachty in the upper, nud twent $y$-twi in the lower jaw. The first thare muhars in the upper, atid the firs four molurs in the under juw, are trenchant, in the unor fow fory points towanls the onter ealee and a small tulecrele poine inger sidu iuturiarly. the there wrus smaller and all furnished with tulhereles. The firt of these tuliereulate molars in the nuper jaw is very harge. In all the wild varieties of the speries of Canis the muzzle is ehongated and the ears are carrim erect ; the tunge is anproviden With entienlar spines: the fore-feet have five foes, the hind feet four only; toth aire armed with non-retractile claws; the cepcum is cylindrical, and conled upon itself
the anal glade are of moderate size: the coitus is pro fonged. The dng (Cianiz fumitiuris, Limn.) is distingtished from the wolf and jackal by his recurved tail lint the varietions, as to size, form, color, and quality of plete, sir, are almust infinite. The dag is the most comover the Lrute and ralnable conquest ever made by wat his particular master, assumes his manners, knows and defends his property, and remains uttacbed to him till death, and all this neither from constraint bor want, but solely from the purest gratitude and trucst friendship. The swifthess, strength, and scent of the dog
lave rendered hion man'e powerfin ally agaiant all other animals, and have perhaps muinly contifinted to the estathlishment of society. Some ninturalists think is domesticated jackal; severthelesa, dors that come again to the wild state, resert neither into the one nor the other species. The wild doge, and those that beloog to savages, us the dingo, resemble, it is true the welf in the shape of the head, their straicht pricketi ears, rough snd thick hair, long lonsky tail, and lowng ing gait ; morcover, hicy nerer bark, but utter a shar, cry or long metancholy howl, like the jackal and woll get they are planly distin't from both. The Enynimanx dogs present the first traces of a deviation from
the wild type; the figare of the legs is more determincd. the wild type; the figure of the legs is more determmach
and thir pace bolder nad more rapid; still they mani fest their near relationship to the wolf in their sharp nose, pricknd care, and inability to bark. The Einquimaux and the people of Kinmtschatka nse these dogs
beasts of draught: six or seven dogs will draw a sledge laden with eight or ten handred-weight nt the rate of seven or eight milesan honr, and will easily, under thes circumstances, perfortu a journey of fifty or sixty miles a day, when the snow it hard and sonooth, and the road level. - The Newfoundland deg may be regatrded as the
bext removed from the Espuimanx variety. These fioe sext removed from the Eaquimanx variety. These five
and sagacions animals are employed in their native istand to draw sledges ard cants liden with wood and elsexhere by the hany other nseful services performan elsewhere by the horse. The readiness with wench the and carry, and his powerful and active swimmint, have been the means of preserving the lives of many linmat being*. Another variety of dug nearly allied to the Newfonndlaud breed, ant belongiog to the same subdivikion (Aviculurius, Linn., or Spabiel tribe), has been tramed by the bebevolent monks of the convent situatihunt ont and extricate gach nufortanate travellers as may have been hurind nader the snow-irifts or axa lanches, while attempting the neighboring dangerons ehepherd's dog offers the exatuple of one of the pured races of the domesticated animul, and that which, in is straight ears, its har and tail, upproaches nearest to the orizinalstock 'fheshepherd'a dog, though outwarily resemhliggin many point-the "dingo," possesses a greater cerebral development, which continnes to increase together with intelligence in the spanael sud barbet. Onided by the form of the cranium, we should associate
the spaaiel and its inmedate varieties with the slept the spaaiel and its immediate varieties with the sher-
herd's dog, the wolf dog, the Newfondland and Monnt St. Bernard dog, and the Engnimaux dops, in one fanily ass). A comparimon of the crania indicates a closer sffinity of the "dingo" with the funily Pugnares, inclading the mastiff amb Danish dog, than with the Saguces. bull-dog, remarkable for the shortness and strength of

Relating to cad nibalism
C'ma'mibalisum, $n$. The act or practice of eating buman fleah by mankind; aothropophagy
(Hist.) In the Odyssey of Homer we have the story of Polyphebsue devouring human flesh; and in Herodotus, The Podei of lulia (Herod iii 99) were in the batit of killing and eating their rulations when they fell ill; killing and eating their relations when they fell ill; Giuton as others wonld believe it. Modern facte, the truth of which is pnt beyond all donlt, confirm the statements of Herodotus. Among the ancient Tapis of Brazil, when the Piaje (chief) despaired of a sick man's recovery, he was by has aulvice put to death and devoured. If.rodotus (iv, 26) also saye that among the medones, when a man's father diex, his relations come und help to eat the dead man, whose flesh they rende nore pulatible ly mixing it with that of some animah enlarged, ind people who had not yot erubraced Christibity wure pretty generally set dove as anthropephari When the Lombards invaded Italy at the end of the bith century, it was reported of them that they ate buman desh: Bul a century later the same aspersions wer cast on the Slavonian tribes. It became the fashion to bandy the accusation between enemies: thos, during the Crusades, the Saracens s.bid the Christians ate husban flegh, we well as the unclean flesh of ewine; while the Christians on their side manataided that the Siracen ate men, women, and children, sad were particularly fund of a kucking Christian have lora frebh from the orry tales are only the Suracens of the lloly Wiars sime through the marnifying-classey of tradition tand ro mance. It tues int much sururise us that in those rud ages men shand try to fix a revolting practice on their worn foes, but we can hardly understand why tho minatrels of the Christians should convert their most ap proved heroos into canmibals, and praise them for the quantity of infidel flesh they devoured. Yet Richard 1 sut in this predicament by the anthor, or anthors, of Ghe romance of Richard Cour de Lion. Accoriling to the poem, the first symptom of the king's recovery from pork, and ns pork was difficnlt to procure in a Molvampork, and ns pork was difficnit to procure in a Soliam-
mpdin country, his couk dressel him a Turk's head, of which Richard ate with good app-tite, and felt limself restored in cousequence After some more repaste of the satme kind, ho is made to say

he soon absudoned the law for literature; but this fail ing to provide him with the means of support, he cont-
menced lusiaess as a wine-nserchant, and failed. Repeated disappoiutments seriously affected his health knd peated disappotuthens seriously affected ho health und bpirits, and he dred, urosem-hearted, on the very day that dire aecessity, had recourse to the stage for support, unit married an actor; he also died, and she then became tho wife of Mr. Hona, a linen-draper of Exeter. But she had the happiness to live to see the success of her son, and to receive from him at all times the teaderest harks of final affection. The friends of his father first placed him at Hyde Abbey School, Winchester, and afterwards at Eton, where he greatly distinguished himself as a grholar, and fornted many connections which wert of played great skill as an suthor in his cuntrilutione to the Microcosm, a periodical work conducted by the ee nior scholars. At Oxford, also, he distioguisbed himselt. and proceeded thence to Liacola's Inn. his oratorical talents snggesting the har as the profession Lest adapted for him. Beiag introduced to the House of Conmones by Mr. Pitt, he abandoned the law, and devoted himself wholly to politics. His etrenauas and able sopport of the minister was rewarded in 179ti with an onder-eecretaryship of state; and in the yesr 1800 be was placed in aflluence by his marriage with Miss Jonnna Scott, the His tulents $\mathrm{m}^{2}$ a pot tiomable, und he made an expert nse of them in the an ticles he coutrilinted to the Anti-Jucobin, a celebrated publication, in which the Whigs were wittily, uomercifully, and in some cases uniustifiably, held op to popnlar contempt. After the death of Pitt, and the dissolittion of the coalition ministry of Fox and Grenville, Canning becane Foregg secretary in Perceqal'e adnin intration : and to him may justly be uscribed the line of British policy in Spain, which veetroyed the hopes of Napoleon, sud led to his final overthrow; for, as he once emphaticslly declared, "his had been the huad llsving, as it was alleged, unfiurly epdeavored to Ilsving, as it was alleged, unfidrly eddeavored to pro-
cure the removal of Lord Castlereagh froon office, took place, and voth parties had to quit office. In I512 he was elected a member for the great commercial town of hiverpool; and in 3hl6 be again becnme minister being appointed President of the Board of Control. In this situntion he made himself extremely nupopular by his detence of the Six Acts, nad otber no leas utinuxions mensores. On the return of Queen Caroline to England in 1520, Mr. Canning retired from office, that he might not have occasion to vote against her. This did not preveat his being appointed Oovernor-ieneral of India in 18z2; and he hind already mate prepnrations for his de cinsed the seals of the Foreign Ottice to be delivered to Mr. Cauning. In conjubetion with Mr. Muekisoon, he now adrocated a cuurse of toth home and forejign polity atrikingly at variance with that of which be had for years been the witicst and reaniest, if not the must pro tonnd, defender. His new policy was us peppular as his old had been obnoxious; atud the Earl of Liverpoosl lwing soized with paralysis, from which there was no bope of his recovery, Mr. Casuing reached the graud olject of his ambition - that of being the acknow lelged heud of the udministration. But thongh the new premier was popnhar with the country, tho party with whom he hat in cult one. Tho opposition to him was fictue almost rap curous: and it was soon obvions that he was suffering both in mind and bexly from user-exertion sumb constant excitement. These, afgravating the effects of a severe colh. canght while rttending the funeral of the buk of York, lrought on a most puinfol inflanmatory thsCumbinge, SAR STRATYORO. made of pleces connected by nuts and screws passing thrmuh thanges projecting from the sides. As it is hath up around the momel piece by piece, the intervening space and ramuted tichely togother. The model and the wonli) of sand aronnd it are nude mbeh longer than the actual length of the gun, that the whole of the gen may con sist of good metal. The preve that projecta from the muzzle when the casting is finished, in comseyuence of this, is called the dear-head, ant is cnt off in a lathe: it contains the semm and impurities of the molten metat, which always rise to the surfate when it is puored int, the moull. The deal-head is also theeful in supplying
the shrinkage arising froun conolins, when the metal conthe shrinkage arising from comoth, whenthe thetat con-
 model are removed, and the mould itself separnted in pieces, which are carefulty built tognther in a vertica position, nal imbedded in ta surrounding mass of satul to receive the molten irun. The mutal, selected for its toughness and hardhess, is then fosed in a formace with conl, athd, when liguid, is allowed to run into the mond which has beeti prepared to recene it. Whe the cast ing is thoromanly ctolen, the deat-hestif is cut off, and the axis of the pieceexactly fonmo by the and of the cenformed, the gun is removed to anmether lathe amil the ringe at the inuzzle anit breech, and thuse ous cither side of the truonions, are carefolly turneti. Great nicety is required in this part of the process, for the torm ition of the bore is regalated by these rimgs. The gun is the raised ly means of points resembling cones, that enter the centrings, to admit of the tramainas beine tarneil by the action of the truanioning-machime; after which the holes that receive the tangent-stile, and the bishit in coppier throngh whinh the vent is bored, are cht by means of a drill. The hole in which this copper plug is screwed enters the bore diagnally. The dianeter of the
vent itself is aht, $1 /$ of an inch. The process of horine is vent itself is nht, $1 /$ of an inch. The process of boriner is
mext performed; the goo is placed in a boring-machinnext performed; the guo is placed in a boring-machin in a vertical position, and the botiog effected ory mean
of a very hard and sharp steel tool, which works at the end of a long iron bar, somewhat after the manner of a centre-bit. Sumatimes the gan is made to revolve, ani to rise gradually as the interior is cut away by the bor ing-tool; and in other methods the gun is fixet, nut the cutting-tuol revolves. The exterior of the gan is then finished-off, und it is afterw.urds taken to the proying chamber. A somewhat different methoil is used at Woet wich for forming the models and moulds of the brass of lironze guns that are cast there. Prior to 1750 , cannon were cast hollow, hut atoout this date the methud of was discovered by a Swisy engineer As the exteriur conls before the interior, it is found to be of much cluser grain than the part which is sulsemuntly removel: and on this account, cannon nade on this system were aoon discovered to be far superior to guns which were cast hollow, the metal of which was nore porons, and, con
sequeatly, much weaker in some parts than in others and as it did not offer a aniform resistance to the fore of the powder in every part, the piece was liatile $t_{1}$
burst at any time. - The above method of castidg gons will be possibly superseded thy the mannfacture of guns out of twisted bsrs of wronght iron, as adopted ly Sir
William Armstrong (8ee Arsistrosg Gux), nthlified amit William Armstrong (8ee Arsistrosg built upon the coil
improved by Mr. Fraser. Both are bill system, and the harrels when polished have the appear nakes a spiral coil of a low-priced filrous iren, welds if into a cyindrical form, and then tnrna and fintishes each cylinder or part separately, lefore phiting the pipces $t$--
gether. Fraser also makes a spiral coil, but in-tead of welding or finishing each coil separately, he coils say spirals in the rough bar on a mandrit, or shaft, anil the welds the whole together. The acompanying figure il Iustrates one of the latest patterns of Fraser guas made

Fig. 499. - 9-inch fraser gun, with wrovght-tron ture. as described. In many resperts the superiority of the wronght-iron over cast iron guns is meontestable, but they were till now so inferior in strength and endorance that, in the large calibres espucially, a coil gun that his
fired 500 rounds is quite a prodiry of endurance. Iesors C. B. Norton and Viblentinc, in their repurt to the govern ment of the U. States on the munitions of war, exhileited at the Paris Universal Exposition of 184 , give the theory of the gradnal dentruction of these large coiled wrought-iron gans as follows:-"The heavy discharge of powder heats and expands the inner tube to a great degree before the outer riugs, which bave no homoge ueous connection with the inner, are sufficiently heated to expand and give the inner tube room; consequently are porticies of the continced, that, when the firing bas ceased and the temperature of the gnu retnros to its normal statu. the temperature of the gnth retnros to its normal state, compressed, do nut sharink sufficiently to bear opon the inger tube, which in subsequent firings has to sustain the entire furce of the explosion, until it heats and expunds so as to get the sapport of the cuils surrobndiug
it. The seam hotween those coila widens ns time wears on, nuid it se not mommuna to kir a gun, that has only huen fired to or 50 times, in such a state that the blate The Fraser system, by probluring it greater deveree of homagencity, has, to emper extont, wereque this thefect. Guns are now made of lohi tons, with olot of 2,010 Has. length of gun, Stift.; chargn, thilha., fired by electricity (S/ech) A heilew cs banter tirough wheli a revehing shaft passes, he the prolunged eng ot a $u$ herd when boreal

magne, and the decrens of the popes from Siricias Anistasilus down to the 1200-11, collected the decrees made by the popes and cardiaalo, and this work wat completed by Gratian, a Beoedictioe monk, and published ${ }^{\circ}$ io 1140 . Ruimundus Barciens,
chaplain to Gregory 1 X ., published in 1234 the decretala which were reseripts or letters of the pupes, io ansuer to questions on ectlesiastical matters sutumitted to them.
The work consisted of 5 books, to which Bunifuce VIII. The work consisted of sooks, to which Bonifuce $\begin{aligned} & \text { and } \\ & \text { added a sixth ia } 1298 \text {. Clemeot } V \text {. alded what were }\end{aligned}$ called the Ctrmentines in 1308 . John Andreas added a commentary cafled the Aorella io the 1317 . To thes have beun siuce added sume decrees by later popes, nod the whole form what is now known as the Corpus Jaris Cunonici, or the great body of the canon law received by the Roman Catholic Clurch.
Canon-lawysr, $n$. One skilled is the choon law. Canion of Geripinre. (Eccl. Hist.) The term canon as applied to the scriptural writings, has been take with varions eignifications At oae tune it expresse simply a catalogne of church belonginge; at another, all boly booke, appointed to he publicly read. Later, it Wha narrowed in its application to thoee inspired writings recognized by Christian believers. The $C$, of the Oid Testnment was the work of many years. The earliest record of the collection dates from $130 \mathrm{p}, \mathrm{c}_{\text {, , and }}$ it quoted by Jusephas: nnd the Jews, it would appear, re garded it with especial veneration. The Alexandrine version was more particularly held as inspired writings by the Jews of Greece, rather than by the Palestine He-
bruws. This version differed from the former io heing brews. This version differed from the former io heing
supplemented by the 14 books of the Apricrypha, which supplemented by the 14 booke of the Aprcrypha, wh
were not juilged to be of prophetic origin, however, but merely as forming an appeadix of pectuliarly vabuable moral and religions precepts. The early Christians first ical ; but later, when the Ilebrew language came to be nuderstood, this judgment wis, to a certain degree, reversed The canons of the Greek Charch clasely rescmble each other. Those of Melito (A. D. 17i), Nazianzen (1. D. 37 ), and of Amphilochius (A. D. 370), coincide with one another in contaioing all the Jewish hooka ex cept Esther, but excluding the Apocryphn. Origen, Cyril (3ts), and the Conncil of Laodicea (363), ngree in including all the Il-brew books, and that of Burach. AthaRuman Catholic Clurch, following the example of the Latins, regarded the Jewish opinion of the Apocrypha as erroneous, and declared them canonical by a decree of the Council of Trent. At the period of the Rufurmation, the theologians of the schonl of Lather repudiated the neceptation of the Apocryphal writings, and ndopted
the Jewish view of them. The $C$ of the New Testament whs fobnter upon, in a great degree, the ruling principles of the Old, and becume ETadually accepted an in-piret writings to a partial extent. Origen held that the four Goapels, Acts, 12 Epistles of Paul, 1 Peter, 1 John, and perhaps, also, the Apncalypse, were mindonhtelty sacred and reavinc, The Cof the Greek Charch excepting the Apocalypse. The Conseil of Ilippo (A. D, 343 ) orlained that the New Trstament should consist of the 4 Gospels, Acts, 13 Epistles of Paul, 1 to the IIe the A pocalypae of Jolin. The Council of Carthage (397) eonfrimed this decree, hat ranked Ifelirews among Pant' 1+ Epistles. Poppe Innocent I. afterwarils decided that the $C$. of the Latin Church ahould itsclude the abure
catalogae. Luther, etill later, excluded Ilelirews, Jamen, cntalogne. Luther, etill liter, excluded Itclirews, Jamew,
Jute, nnd the Apocalypse. The Council of Treat ( $\mathbf{1 5 1 5}$ ) Jute, and the Apocalypse. The Conncil of Trent (1515),
in coufirming the $C$ : of llippo and Carthage, establiahed them ly eermmenical nitherity. The Greek Church Apoeryplin, the Catholic Epiatlea, and the Apocalypse The sucinians nad Swedenborgians lave since taken othor vinws, hut, kenerally speaking, the three Churches Catholic, Greek, anil Irotestant, have received as canonlual the entirety of the lloly Sriptures.

are the rale, those of mud, stone, and wood proving the
exception. The resideaces of the lower orders are, how ever, but wretched mad bovels. The foreign factorie or honge, as the Chinese chil them, are situated in the
S.W. Buburb, where they extend from E. to W. for shout $11 / 2$ furiong. They occupy a muddy flat, which has been gaioed from the Choo-Kiang River, which they fide. This separated from it by a quay about lougnrus the European merchants, is railed in, and forms a proמreoade, called Responelentia Wulk. Near it is amother small opeo space, abobt 50 or 60 yards square, walled in, and laid oot as a garden, with gravelled walks an flower-Leds. These darrow limits, antil recently (see CuINA), bounded all the territory assigned to foreigners within the Celestial Empars: even the quay and enculty and the European and American merchants conld not build a few steps on the water's edse with out express p.rmisson from the authorities. There are 13 hongs, or factories, inclnding the American, British, French, Dutch, Austrian, Swedish, Danish, and Parsee establishments. They are among the bandsomest build iogs in the city, and usbally consist of three, four, of more brick or granite luildings surrounding a kind of close, or court: two tolerable Europeas hotels occnp. portions of two of them. Fires are frequent, and the Chi nese bave very generally adopted the use of engines for their suppression. The city is sutgect to inundations, pnmerous reservoirs, springa, and wells. A large part nnmerous reservoirs, spridga, and wells. A large part
of the pop, of $C$. resides on the water. For 4 or 5 miles opposite the city, and both above and below it, the river is crowded with vessels and rafts of all descriptions and sizes. Each one is registered, and the whole number in the neizhhorbood of tho city is reported to amonnt to 84,000 . Epwards of 120 different temples are enumerated in, and adjacent to, the city, avd this does not include the whole number. The principal is the Buddhist temple on the istand of IIonan, in the rive opposite $C$. Its buildings are numerous, chiefly of
brick, and it envers, with its courts and gardens, 6 or brick, and it envers, with its conrts and gardens, 6 or
8 acres, which are surromded by a lofty wall. Ther 8 acres, which are surrommed by a lofty wall. The N
are two ther considerable Buddhist temples in the W. part of the old city, and also a Mohammeda mosque, with a dome and minaret 160 feet in heiglit. ably one of the latter, estallished by an American mis sionary in $\mathbf{1 8 3 5}$, bas been prodactive of much benefit There are 14 high schools, and ahout 30 colleges in thi city, and it is estimated that about hatf the inhabitants are able to read. The manufactures of $C$ are numerous and important; silk fabrics, fhoes, and brass and ironwures being the principal. The hook-trade is considerable. A great part of the trade of Chipa with the rest of the world, passes throngh $C$. The Russians are the onty nation not having a resident or factory here. The European trade, now so imniense, originated in a com and the Emperor of China, in 1517 . In 1634 sume Iritish ships first touched at Canton. In 1680 the direct trade of the Rast India Company with Chim commenced. The great mass of the foreign commer is carried on by Kinglish and Americans, but the ChI nesc art grimbally becoming antive competitors for this trade. Toat is the great article of expert, next to which comed silk and cotton. A bout $15,1 / 00.00 \mathrm{k}$ Jbs, of tea, and 6,000,000 lbs. of raw silk are annually imported from C. into the U.S. There is a direct line of steanera between San Francisco and Canton. The entire trade between $C$. and tho U. S., is valued at $\$ 10,000,000$ nonually. Pop, 1881, est. 1,600,000,

anzone, (an-zine, $n$. [Tt, from cantare, to sing.] (Poet.) A kind of lyrie poem. Adoptet, with some altera into Italy in tho 13 th centory. It is divided, like the Greck strophic odr, into stanzus, in which the number and place of rhymes and metre of verses respectively correspond. The lavt stimza, commonly shorter than the ethers (the ode of the epodus), is called congedo or ripresso (in old Frupeh Traroy), and consisted, generally of a valedictory address to the canzone itself. It received its clasionl stamp principally from Daste and Petrarch: and with Tasso and Chiabrera it began to deviate from Canzonet.
Canzonet, (han-zo-net') n. [1t, canzonetta, dim. of
eanzone, a song. Sue Cixro.] (Vus.) a short sing, in canzone, a bong. sue Cisto. (Mus.) A short sang, in ose, twe, or thres parts. The Neapolitan C. has two sung twice over. The Sicilian $C$. is in a kind of jig-time, with six or twelve quavers in the bar. Sumetimes both are rondos, and repeat the firet strain for an ending. (aonfehine, (kienot'chin, ) $n$. (Chem.) $A$ liqnid eu stance ubtained from caoutchouc or INDIA-RERBER, $q$. v. Caontebone, (kio-ont'chouc,) $n$. (Bot.) The Indinn name of a very valuable substance, called also Gum-elus-
 binous mueral, resemblung cacutchouc in elastic bithproperties. A few specimens of this enletance have been foond in a lead-mine in Derlyshire, England; nnd Cap, (kop,) n. [A. \& , coppe. Dan cup, Ger kappicut. cuppe, probsbly from the ront of Gr, sliepaō, anciently kepō, to coser.] A cuvering for the hicad; the garment that covers the head.

Here is the oap your worship did bespeak."-Shaks. An ensign of a certain dignity ; as, a cardinal's cup.

Henry the Fifth did sometimes prophesy,
If once he came to be a cardinal,
If once he came to be a cardinal,
Hed make hus cap co-equal witb the crown."
-The top: the lighest; the uppermost; as, the cap of mountain-perk.

 quid ascends, Fig. 505.
ed, according to whether the tubes are moistened by the liguids or nut, as represented in Fig. 545. The amonnt cording to the diameter of the tulue. Gay-lusac lins debunstrated that liquils ascending or luring deprexsent in capillary tubes are governed liy thesp laws. First. that a liquid ascends in a tuhe when it moistons it, and is depressed when it does not; secondly, that this astceut and depression are in the inverse ratio of the tij ameters of the thlee, so long as these do not exceet two or three millimetres; and, thirdty, that the asrent and depression vary with the nature of the liquid and the dent of the thic kness of the tule and the mature of the sulnstasce, prosided that it is mopistened by the lignide These laws hold cood in tocuo as well as in air. Analogons capillary phenomens occur whell two bodies of any kiven shape are immerved in water, provited they are eufficiently near. It two parallel plates of glibs are inmersed in water, at a short distance from one upother, the water will rise between them in the inverse ratio of the separnting distance. If the plates are immersed in murcury instead of water. a corresponding depression is the result. When two flouting balle, both moistened by the liqnid, are so near that the surface between them is not level, they are aftracted the liquid in whichs they float ure aleo uttracted in the Enme manner. Balle pudte of cork are inatances of the former, and lialls made of wax of the latter. It ove floating loall is moistened by the liguid and the other is not, both balls are repelled. The theory of capilfary attraction is one of the most difficult is pliysice, and can only be completely treated hy mathenatical analysia. It has heen more especially studud ly Laplate, Climent, and Poisson. The efficts of capillary attraction are to be olservel in many uperatione in nature. Insects can offen move on the eurlace of water, because their fret are not wottef by the flaid, and a depression is cammed the eurface of whter if covered with oily matter. Oil ascends in the wicks of lamps liy capillary attraction, ascends in the wicks of amps $\begin{aligned} & \text { and } \\ & \text { and }\end{aligned}$ other porous snlustances, by the same force.
Cap'illary, $n$. A tube with a very small bore; a fino vesotl or catnel.
(Anat.) The capillaries, or capilary vessels, are the minnto blood-vessels of the body, which firm the conuection hetween the extremities of the arteries aud the veins. They vary in size from $\mathrm{r}^{30} \mathrm{t}^{\text {th }}$ to $3000^{\text {th }}$ of nn inch in diameter, being smallest in the brain and largest in the bones. It is in the capillaries that nearly all the chauges in the hlood take place. It is in them that its cartonization is effected und animal beat produced, and from them that the bile. sweat, and uriue

- A kind of head-dress formerly worn by ladies.

Cap'riped. a. [From Iat. capra, goat, and pedis, a foot.] Having feet like those belonging to a goat.
Cap'rizani, a. [From Lat. caper.] (Mcl.) Uneven; leaping: as, a caprizant pulse
Capro'ie Aeid, $n$. (Chrm.) An acid obtained during the sapunification of butter or cocoa-hut-oil, or ly ox i dizing oleic acid by nitric acid. It is liguid at ordinary temperatures, has a sweet and pungent taste, and a Faracteristic odor of acio perspiration. If boils at 38 pared by hoiliny cyanide of amyl with alcoholic solution of potash. Ammonia escapes, and a crystalline remidue of caproate of potashs is left helind. The salt is dis solved in water, and sulphuric arid is addell, which unites with the potash, lesving the caproic acid flonting on the surface. Caproic acid formas monulasic salts with the bases. Form. $\mathrm{C}_{32} \mathrm{H}_{10} \mathrm{O}_{4}$
Coproic Alcohol. The hydrated oxide of caproyl or hexyl, the sixth in the series of the homologons rudicles. It is often called hexylicalcohol. It is ohtained from the fermented mark of the grape, along with propylic. lintyfractional distillation. It is a colorless aromatic liquid of specific gravity -832 , and is boils at 3020 Fabr heating it witl hydrate of potash caproate of potush is formed, in the same manner that acetate of potash is formed from vinic alcoluol when it is heated with hydrate of potash, acetic acid bearing the same relation to vinic alcohol that caproic ncid does to caproic alcohol.
Caprric Ether. The caproate of ethyl, and must not be confonnded with caproylic ether, which would be oxide of caproyl-a substance as yet unknown. It i prepared by distilling caproate of baryta, alcohol, rud sulphoric acid together. It is a limpid, oily fluid, buit ing at $324^{\circ}$ Yahr, and possessing an wgreentile fruity odtr, resembling that of pine-apple.
C'ap'ronny's, n. [Gr. kapros, a boar, nnd mus, in mouse. family. in Mincis, a post-office or Boone co, 21 m Ca'peon, in Mi
Cap'roy l, or Hex'yl, $n$. (Chem.) The rndicle of cmp roic nlcohol is turturd hexyl, frum heing the sixtliof the homologrous radicles forming the ntcohotic series. It is ohtained by the electrolysis of cuanthylute of potash as a fragrant oil, hoiling at $399^{\circ}$ Fahr. It is n perma nent substance, and rounins undecomposed when ank nitric acid; lut by mix ing the two it is clatngent intog foty acid,
 of the humulogutus istewholic neries, ohtasined by freating the chloride of capryl with nactallic sadium. Ita prapertien have not yut heen thoronghly iuvestignted. Flarm. $\mathrm{C}_{16} \mathrm{IH}_{1}$
Cupry die seid, $n$. (Chem.) One of the volatite neides oltatued by Chevreul during the supenification of inatter. It im also oltanined by the action of nitric of oleic mid. It is a colorlexs, oily liquil, insoluble in water, lint soluble in alcolol and ether, with a disagree whte sitiorircrmo inch. 1 caprylate of lury ta with mulularie achl it formo menn capres salts with the lunes, which base nut as yet been examinct. Fhrm $\mathrm{C}_{1} \mathrm{II}_{4} \mathrm{O}$
flaprylic Alcohol. Caprylic or octalic nlcohol in the Hydrated oxide of eapryl or ectal, us vinic alcohos is the hydratel axdde of ethyl. It occure in kmall quantities in the fermented puif if the grape: lat ita mowt avioilrible moure in cmuturedi, which containe a computmel of glycroine and ricinolic acid. This compuual, when heateyl with hydinite of potash, in resolved inte hyilengen, andinte of potash. and octylic alcohol. The follosing it the procenn for ites prepuration, recommunded in Miller: Blesubponificil bs muan of patasle or soda and nfterwarde sin supcess of the hydratem alk ili in adderl, mmounting to onelasif the ail used. The mane in heaterl in in returt, ant un olly liquid cowneyl with water diwtiln uver. Thim
 eral times with protanh, until the reathlue in no longor
colored brown. Octylic alcohol is a colorless hiquid of a (ap'ovtosae, $n$. (Tht .) A name given to the fusail enpowerfol aromatic odor. It is insohuble in water, bit
diesoives readily io acetic acid, ether, and alcuhol. It spec. grav. is - 223 , aud it boils ut $356^{\circ}{ }^{\circ}$
Oaprglic Ether. This Dame is generally piven to the Caprytate of ethyl, which nayy lead to confusion with true caprylic ether, which would be oxide of capryi
Caprytate of ethyl is a colorless liquid, with an urree able odur of pintapples. Caprylic acid forms ethers able odar of pite-apples. Caprylic atid forms ether Wills and others.

D. loog. The principal merit of his pictures consists in the coloring which is pure and vigurons: the tints ar few, but true to nature. The obscurity in which he involves his design, gives it a certain air of mysterions grandeor; but his figures are replete with the unre deemed vulgarity of the models from which he studied, and the extravagance of a self-taught conceit aggravated
by abauloned habits. His priocipal works are, a $S($. S. by abamboed habits. His principal works are,
bastian, in the Capitol at Rome; the Supper at in the Porghese Palace; aud the Entombmeat of Maris in the Borghese
in the Louvre.
Caravain, (kar'a-van,) n. [Fr. caravane; Ar. karwan, from $k a r$, trade, commerce.] A company of merchants, travellers, or pilgrims, who associate together in many parts of Asia and Africa, that they may travel with greater security through deserts ani other places in
fested with robhere, or exposed to other danyers. The fested with robhere, or exposed to other dankers. The
commercinl intercourse of Eastern and African nations commercinintercourse of Eastern and African nations
has from the remotest ages heen carried on chiefly by means of $C$, as the goveroments that hate spruby np in those continents have seldoun been alle, even if they for individuals. Since the establishnent of the Muhammedan faith, religious motives, with others of a less ex alted character, have tended to augment the intercoursi between different parts of the Eastern world, and to increase the number of the caravans. Johammed, as is well known, enjoined all his followers to visit
Mecca onee in their lifetime; and large caravans assembled for this purpose in every eonntry where the Mobammedan faith is estahlished. There are fomr regnlar C's which proceed aonually to Mecea; the first frum Damascus, composed of pilgrims, travellers, and merfor the Mohammedans of Barlury the from Caim, bith, near the month of the Red Sea, where those of Arabia and India meet; the fourth from Babylon, where the Persians assemble. Every $C$ is uoder the command of a chief, or aga (caravanbashi), who has frequently nnder him such a number of troops or forces as is deemed sufficient for its defence. When it is practicable, they encaup aear wells or rivnlets, and olserve a regu-
lar discipline. Camels are almost uniformly used ax a lar diseipline. Camels are almost uniformly used ax a
means of conveyance, in preference to any other animal, means of conveyance, in preference to any other animali their peenliarity of stracture, which so admirably fits them for travelling through desert wastes.
-A large, close carrage, or a train of ench; used for the tion. - In Russia, a fleet of larges, or beats of large size, usell for the conveyance of bemp, tallow, \&c.
Caravaneer', $n_{*}$. The condnctor of a carayan.
Caravan'sary, Caravan'sera, $\pi$. [Fr, carararvans.] A large public building, or inn, for the reception and lodgment of caravans in the desert. Though serving Instead of inns, there is this essential differebce between them, that the traveller fiods nothing in the $C$. for the use either of hinself or his cattle, hut must carry all
his provieions and pecessaries with him his provieions and mecersaries with him. C, are also
nomerons in cities, where they serve not only as inns, nnmerous in cities, where they serve not only as inns,
but as shops, warehonses, and even exchanges.
Car'ave1, ''ar'vel, $\pi$. [Sp, carvlla; Lat, carobus, ceacrah; a stmall wicker-boat cosered with raw hides, (Nout.) A kind of light ship, formerly mach used by and was galley rigged.

Main." - Fanshaws
-A vessel used in the French herring-flshery.

Carbineer', n. (Mil.) Sce Cababineer.
Carhol'ic Acid. Phentic Acib, llidete of Paenit, Phenole, Hyoanted Oxide of Phentl, Puesilic A lcohot, $n$. (Chem.) A very abundant prodnct of the distillation of coal. Laurent obtained C.A. from oil of coal-tar by collecting separately those portions which boil be-
twren $300^{\circ}$ and $400^{\circ}$ Fahr. By mixing with this vil a twren $300^{\circ}$ and $400^{\circ}$ Fahr. By mixing with this oil a
host saturated solution of hydrate of potash, a white crystalline sulistanceseparates, the supernatant liquid is de canted, and the crystals hre dissolved in a small quantithe denter of which contains carbolite of potash. The potash is abstracted liy the athlition of hydruchlorie seid. and the liquid earbolic scit rives to the surface. The carbolic acid solution is digested with chloride of calcinm to remove water, sud afterwards exposed to a low temperature. It then erystallizes in long colorless needles, which must be kept from contact with the ntmosphere. C. A. melts at 45 , and hails between $365^{\circ}$ and $330^{\circ}$. The slightest trace of moistare is suffirint to
came the liquefaction of the crystals. $C: A$ is brit sparingly solulle in water: it is, however, readily dissolved by ateohol, ether, and acetic acid. It has a burning taste, and an otor of smoke resembling creosote. Its selution amark on paper if let fall upon it. A splinter of deal dipped in $C$. A. and then into nitric acinl lecomes dyed blue. Form. $\mathrm{C}_{12} \mathrm{H}_{6} \mathrm{O}_{2}$.- The Tisinfectant. or rather antiseptic properties of (: A. are very remarkahle. Re-
cognized some twenty y ears ago, and used with marked success during the prevaleoce of chelera by the Frenchman Dr. Jnl-s Lemaire, it is only at the present day that the preventative and curative pripurties of this powerful
agent have been evidenced. Largely used for the trentagent have been evidenced. Largely used for the trent-
nuent of putrid sores, and warmly advocated in cases of menolos, whoopiog-con h , fovers, diphtherin, scarlatima, mensles, whoopiog-conyh, fevers, diphtheria, scarlatina,
Sc.. we helieve that when it shall have tien fairly studed and tested by patient experiment, the number of
important uses to which it will the found spplicatle must be consuderably ibereased. - This acid has besides received important applications in the arts as a disinfectatut and deodorizer, namely for the preservation of twood, sking, bones, ani animal subetances generilly.
It is also uscd in spinning, lyeing, and calion-printing. It is also used in spinning, tlyeing, anul calico-grinting. An elementary bon-metallic, solid hody, very widely dif. fused thrumghut natore. Its pureat und rirest form is that of the damonal chaccoll it ocrurs very abmadantly in bearly every part of the world. It also occurs, in ennbination with oxygen, as carlousic achil, in small quantities in the air, and in the watery of nust springt. In combioation, is carbonic acid, with lime and magnesin,
it occurs, in eoormous quantities, as hmestone, marble,
chalk, dnlomite, dc.: whildet, combinal with hyilnugen,

cold nnder which the acid solidifies, forming a whit concrete substance possesied of very extriondiaury properties. SIr. Farsday uas the first who hquene lo it was first described as a solid ly Jl Thilonrier. At conimoa teoperatures and pressures, water absorbs its own volnme of carbobic acid; under a pressure of two atmospheres it dissolves twiceits volubet, slizhtly ponigent and sonr tiste to water impregnated with it: it also confers the effervencent quality upop many mioeral spriaga. Carbonic acid is recugnized ly its renilering lime-water turbid. It extiogushes flame and suffucates animals; heoce the minerd call it choke dump. Carbonic arid is contained in marble, chalk, and all tha varieties of limestoue, from which it is extracted by strong heat, as in the process of barning lime; or by the action of strunger acids, in which case the carbonic acid escaped with efferrascence. Monntaine of limestune, This gas is nlso produced during the respiration of onimads, and is evolvid in the process of fertoentation. E/uivalnt, 22; sp.gr. 1-529; form, CO
Carbonic ©xide, $n$. (Chem.) Curbonic oxide is produced when carbouic acid is p.assed over red-hot char coal: from which it will be seen that this gas is formed during the combustion of ahnost every organic substance. The first result of combustion is, of course, carhonic acid, which, passing over the red-hot couls or wick, as the case muty be, parts with an equivalent of its oxygen. The gas, however, is inflamed as fast as it is formed, and re-connected with carthonic ucid. It is hy sutphuric acid. Oxalic ncid consists of $\mathrm{C}_{2} \mathrm{H}_{3}$ unitad to an equivalent of water, withont which it does not appear to be able to exist. The sulphuric acid abstracts aeparate into CO , carbonic oxide, and $\mathrm{CO}_{3}$ carbonic acid. The latter is alroorbed by passiug the mixed gases through milk of lione. Carbonic oxide gas thus prepared is coloriena and inodorons, burbing with a blue thame, and giving rise to carbuaic acid. It aupports neither combinstion nor respiration, one per cent. pixed with air being sufficient to canse dangerons drowsiness. It is now satiefactorily proved that the coma georrally resulting io death produced hy the combustion of charoxide ly the carbenic acil furmed dariog combustion being exposcel to the netion of so mnch incandescent material. It is a nentral body, has no action on htmus paper, does not conibibe with acids or lonses, and has never heen liquefied; it is slightly eoluble in water. In metallorgical processes, carbonic acid plays an impor tant part by supplying fnet as fast as it is formed. Eiquivalent, 14 ; sp. gr. 0.967 ; form. CO.

## CARD

CARD
CARD

Card, $n$. [Fr. carte: from Lat. charta, papew ; Gr. cherSes, a leaf ot the Egyptian papyrus.] A papur or pliece
of pasteleard, used in games, $\dot{\delta}$.; a piece of pasteboard of pasteleard, used in gamess, de.; a piece of pasteboard
on which is inscribed a person's oame, adurcess, \&c.; ius. a playink-curd, a visiting-card, \&c
a playing-curd, a wititimg

- A published nutification,
ment, explanation, $\& \mathrm{c}$
-A paper on which the points of the compass are marked.
"Upou his eards and compass firm's his ese
The masteris of hit loug experument." -
-v. i. To play at cards; to gime - Johnsmm.
Playing Clards. Oblong pieces of pastebuard, inscribed with certain figures and points, und nsel in various is obscure. While it has by some been erroneously at tributed to the Romans, hy others it has heen tracel, perhaps with more plansibility, to an A siutic source is certainly unteasble. C. may have leen osedia Franc io 1390; but that they were not iavented to manus Charles VI. is evident froms the fact that they are menTiraboschi speaks of them as used in laty lifore the close of the thinteenth century; and the ganan is notice io many German books throughout the furtevith cull tations of the four great classes of men: and tho names sttached to these figures in England arose from misapprehension of the eames oricinally assigned to them. Thus, by the heurts are meant the pens de charu
(coear), the choir-men or ecclesiastics, anil hence thes are called copas, or chslices, by the Epaniards; whos word espada, 8 word, indicating the nobility und warrior The cluls were origigally trefles (trefoil leares), and do The clubs were origiaally treffs (trefonl leares), and d were marked by the diamonds (carroauz, square tiles The word kware, (Ger. knab, boy,) nas used, of conrs iu its older sease of servact, or attendant on the knight The French C. long retained the names of the four king David, Alexander, Casar, and Charles, who marked respectively the Jewish, Greek, Roman, and Frank empires. The queens, Argine, Judith, Esthet, ami Pallas are not so easily acconoted for. The first name fur nishes an asuyram of regina, or queen; the others may have been chosed as typos or the mornt quatities of wi dotm, purity, and courage. The modern pack of C. cond diaraonds, aod two black, ipades and clubs: each suit consistiog of threecourl or picture cards, the king, queen and knave, and ten other cards distinguished by the number of their "pips" or spots, frum ten to one respectively. The lowest of these is always called the
"ace," and the two sod three are often called the "dence" aod "tray." The natural rank of the cards in each suit is, king highest, and so on dow a to nce low
est; bnt in many gatnes this rank is varied, as in Whist where the ace is put highest of all, nbove the king; i Ecarté, where it is pat between the knave and the ten sod in Béziqne, where it is made the highest, but wher the ten is put betweea it and the kiage of the $C$. is variable in every hand Sometimes the pack of $C$ is redaced to thirty-two, by excludiag the six, five, four, three, and two of each soit it is then called a "piquet pack." Ath immense variety of games are played with $C$, some involving chance only some combining chance and skill, the best of them furnishing vory agreeable snd intellectual smusronent Some are round gomes, in which any number of person masy join, as Iingt-un, Speculation, Loo, Pope Joan, \&c some are for four persons, as Whist (the best of all, and a very fine game), and Quadrille; some for two, is Pcquet Ecarte, Bézique, Cribbage: and, lately, Fames ha
introduced even for one person, called Patiance.
Card, $n$. [Du. kaarde; Lat. cardsus, a thistle: 1t. cardo.] Card, n. [Du. kaarde; Lat, carduus, athist opening, and breaking wool or flax.
$-v$. a. To comb or open wool, flax, hemp, \&c. with a card.
The while their wives do sit
Beside chem, carding wool. ${ }^{*}$ May
Cardamine.n. [Gr. kardin, heart, damao, tostrengtheu; from its stomachic properties.] (Bot) A genos of plawer, Lalys-smock, or Bitter-cress, fuand in sxamp N. of New York, blossoms in April or May, when its flowers. which are flesb-colored, white, or a little purple, in a termioal raceme, present a very plensing aj-
pearance. The leaves are anti-scorbntic, and are sons-
fimes eaten as water-cress.
Car'dannom, n. (Bot.) The oame given to the capsules of plants belongiog to the kenera Amomom and Eletwriakled seeds which fona sn aromatic pungent spice wriakled seeds which fono sn aromatic pungent spice,
weaker than pepper, and with a pecoliar lut agreuable taste. Oa acconot of their cordial and stimulant properties, they are employed in medicine, very generally to qualify other mediciues; they are also used in cos and called True or Officinal $C$, also koown in conmerce as Nolabar C, are the produce of Elettaria Cardamonumi.
A bative of the mountains of Mahar and Canara. They depend for their qualities on a peculiar pungent essential oil, called ol of Girdomom, which may lee obtaiachl from them by tistilling with water, and when fresh, is colorless. Other kinde of C. oveur in Canara, but

## CARI

CARI
CARL

Car'gason, $\quad$. See Caroo
Car'oo, n.; ph. Carooss. [Sp. cargo; W. carg; cargu, to load, from car, a velicle.] The loud carried by a ship: the freight: the goods, merchandise, hading, or what ever is carried byas a cargo of coale.
"This gentleman was just ntted out for the university with
Car'zoove. u. (Znül.) See Colimbid.s.
Carheil. EtLenne de, a Jesmit missinnary among tho Ifron and lroqnois Indians in Canada. He first visited these tribes in libs, obtained n complete mastery of
their language, and was regarded by the savages foth as a saint and man of genius. Tbe date of his death is inknowo
Caria, (ka're-a.) (Anc, Geog.) A country of Asia Miour, whose boundaries have been dissinular in different nges. Gend N. of the Icarias Sea, and at the W, of Phry Major and Lycia. It has been ealled Phenicia, becauso a Plonuician colony first settled there. It afterward received the pame of Caria, from Car, one of its kings who first invented the angnries of hirds. Its chie town Was Halicarnassus.
Caris'eo, a maritime town of Vepezuela, prov, of Cu-
nuna, 35 m. F.N. E. of Cnmann city: Lat. $10^{\circ} 80^{\prime} \mathbf{N}$. Lun. $63^{\circ} 40^{\prime} \mathrm{W}$. Mach cotton is grown in the peigh N., Lom aod the climste is unhealthy. Pop. estimat 1
Ca'riated, $a$. Affected or injured by caries ; carious.
Caria'ti, a seaport-town of S. Italy, prov, Cusevza, o s high promontory, wasloed by the fonian Sta, 18 m .
S.E. of Rusano. It is a wretched, poor place, having S.E. of Russano. It is a wretched, poor place, having
anffered much from the depredations of the Turks and anffered wuch from the depredatioos of the Turks and
Algerines, but it is now inuroviog. The best maona of Calabria is prodnced io the vicinity. P.p. 3,436.
Car'ib, Car'ibbee. (Geog.) The name giveo by th ines found on the smatler of the West India Islands un also inhabiting some part of the adjacent American cuotigent. The natives of the larger and more northern island entertained a great droad of this race of $C$ from thei more warlike snd eavage nature; and the Spaniards, andiag thetn always a bold and determined eneay, dal $y$ expelled all but a mere remoant from their nitivi ly expelled sil but a mere remoant from their nitive
possessions. Those who escaped the Spanish swor sought refuge oo that part of \&onthern America neat the month of the Orionco, except a few whom the Eny lish removed anil landed on the island of Rnatan, in the Buy of Houduras. The C. have al ways been distinguished from the rest of the American peoples by their athletic stature, firmness, conrage, and resolntion. They treat all other aborigises with contempt, and consider themselves superior to every other race. They were firmerly accused of canoibalism, and, there is much reason to
suspect, with justice.
Caribles'an, $a$. (Geog.) Pertaining to the Caribbeat Caribbe'an, Carribbe'an, or Carribe'an sea. the souther portion of the grent bonnded by the N. sbores of Sunth America and the shores of Central America as far as Yncatan, aud beyoad that by the coasts of Cuba and St. Domiogo To the $\mathbf{E}$. it is pearly shat in by the chain of the Aotilles, terminatiog in Trinidad. It containe mor than $1,250,000 \mathrm{sq} . \mathrm{m}$. of water. The C. S. receives some important rivers from South America. It has also a maribe cnrrent which sets into it from across the Athan-
tic. Ite waters accumalate, owiog to the set of this curreat, and are furced to pass into the Gulf of Mexico whence they can only escape by the oarruw passare le Whence they can obly escape by the oarruw passage the Gulf Stream, q. v. The C. S. is entirely intertropical : its waters are very warm, and its depth is generally between 500 and 1,500 fathoms. It cuntaine the important islani of Jamalca. There are no coral reefs in it. except along part of the sonth coast of Cuba. Its bed is occasionally disturbed by earthquake action.
Car'ibbee Islands, or Lesser Antiles, the name eometimes given to that portion of the W . Iudies that inclodes the vast chain of islaods which extends, in a
circular swepp, from Anguilla on the N , to Trioidad on the S . They comprise the whole of the Windward and the more $S$, portion of the Leeward Islands. The principal islands, reekoning from the N., are St. Kitt's Antigua, Guadaloupe, Dominica, Martinique. St. Lucin, tigna, Onadaloupe, Dominica, Martinique, St. Lucia, They derived their name from having been mostly ocenpled, at the period of their discovery, by a tribe of 1 .
Car'ibor. n. (Zaid.) See ReinneEr.
Car'ibon, In Maine, a post-office of Aroostonk co-
Cariea. (kui're-kã.) $n$. (Bot.) A genus of plants, order Papryacor. The species are autives of Sonth Americia sud the trapical regiobs of the old world. The acrid milky juice of C. digitate is said to be a deadly poison.
The juice of the unripe frnit, and the powdered seeds of The jnice of the unripe frnit, and the powdered seeds of C. popaya, are powerfal anthelmintics:
wheo cooked, is edible. This plat is sail to have the property of readering meat tentler. It is stated that pewly-killed meat bing among the leaves soon becomes soft aod delicate, and that the flesh of old hogs and old pooltry fed oo its fonit or leaves is remarkahly tender. The leaves are used in some districts as a substitute for
soap. The jnice is said to tie a highly soimalized prom duct, resembling aoimal albumen, in its characters and
Carieatinre, (karli-ka-tūr,) n. [Fr., from It. caricatura, from carware, to load, to charge, from Lat, carrks,
a car. $]$ (Painting, dc.) An exaggerated representation of any object, in which any natural defects are over
charged, so as to make it alquenr ruliculoos. $f:$ in th bir torial art occupho the shame place that burlenpuedue is literature. The legitnate oljects of the obe and in tho other are the wres und follios of individnals of of pharater which arise from these. External deformi tims, which do sut piring trom the fanlt of the pereon aticted, can never tee puphrr subjects of $C$ ? The ancients employed C $:$, ns wir find trom their masks. Among Itabish paititers, lecobardo da Vinci is a master of the wrt, representing the quarrelsotue braggart, peevish gluttonons, thwnish with an exaggerated filclity Amonit the Fiench, Cablot, and amosig the English Iloparth, staud prominently out in this art. Th Italiaus lave toostrong a sense of the beantiful to hat great relish for C:, and the Germans are tow grave t expecimens of modern C: are to be found in the pages of the hubhumadat Enclish l'unch, atod the Freach Charivari Carieature, ${ }^{\text {a }}$ a. To represent by caricature; to ridcule puctorinlly; to burlesque; as, to caricature persom.

Carientas'risi, $n$. One who is skilled in caricatures 'arieotr'raplay, $n$. [Lat. carex, sedge, and fir. gra
 ease of the bones, analogons to nlecration of the sof parts. It differs from necrosis in that, in the latter
the bone is destitute of vitality, which is not the cas when it is simply carions. Necrosis corresponds to mor tification of the soft parts. Carics most frequedty at tacks the honess of the spine; but it may untect any of the bones, expecially such as are of the spongy texture, as the carpal or taral bones, or the Leads of the long bones, when they form articulations. The young, or those of a scrofulous linlit of body, are most sutject to thi diseasc. It sumetimes uppears spoutauconsly; at othere with inflammation, nsually uteoded with a dull, hegav pain And weakness in the part sffected. In conrse of pain midd weakness in the jurt sfected. In conree of bursts and dischanges ia thin fluid cootaioing particles of the bones. In caries of the vertebra, curvature of the spine takes place, more or less, scourding to the number of vertebre uftected, and paralysis geweraily gets ioAt the articnlation of the bones, the part enlarges, the cartiluged become uffected, and nopputation or excision
of the juint is often necessary, io order to save the paof the juint is often necussary, io order to save the pa-
tiont's life. Much may be done in arresting the pro"ariarmon

CARR
CARR
green, which is the sacred color of the followers of Ma-
homet. Io the U , States the manuficturo of $C$ do homet. Io the U. States the manuficture of $G$. fo very extensive, and carried on to grent prrffction, owink Biselow, of Boston, that have entirely revolutionized thi branch of manufacture, where stean-power is applied. The business is actively carried on in varions states chiefly in Massuchusetts, Connecticut, Nuw York, und Pennsylvinia. The principal kinds of $C$. made in this country and in England are the Brnssels, Wilton, Kidderminster, Tapeetry, Axminster, Threc-ply and Ingraio, Dutch, Venetian, Printed Felt and Drngget carpet. The Brussels Curpet is a mixture of lineo and worsted, but, like the Turkey carpec, the worsted only is shown ho the upper surface. The basis or chation and leetween the upper and under thrcads linen fabric, and between the upper and under thrcad
of the weft, several (asnally five) worsted threals different colors are firmly bonnd in. The pattera is pro duced by drawing to the snrface, between eath reticula tion of the cloth basts, a portioo of the worsted thread of the color required at that spot to prodnce the pattern: these updrawn portions are formed into loops, by lieing turned over wires, which are afterwards withdrawn, and the loons thas left standing above the basis form the figured surface of the carpet. This will be better nnderstood by reference to the diagram, Fig. 52I, which is a elightly magnified section of a Brossels carpet, cit across the wires and the threads of the weft. The large dots above are the sections of the wire; the smaller dute, these of the weft or shoot threads; the W.wichlines, the
warp; the parallel lines, the five colored worsted thrads; and the loons over the large dots are the upirausi worsted threads forming the surface of the $C$. The machinery and processes by which this urrangement is produced are rather complex, and requive to be seen
to be fully understood. The willon $C$ ! is made like

Fig. 521. - CARPET-WEAYLNO.
the Brussels, but the wire has a groove in its upper eurface, Fig. 521, and instead of heing drawn out, it is itberated by passing a sharp knife thronch the worsted loop ioto this groove, and thus making a velvet pile sur-
face instead of the looped thread. Kidderminster $C$ sometimes called Sontch $C$, present the same pattern on both sides, with the colors reversed: thus, if red stars are shown on a white ground on oge side, the other side will present white stars ou a red ground. These $C$, consist, for the most part, of the interweaving of two cloths, which are woren at the sane time, each cluth beine perfect in itself, and necessarily of different color. TupesBrussels and Wilton $C$ are manufictnred : hut only ood yrussels and insed instead of tive or more of different calor ss in the $C$. just named. This yarn is dyed at difierent parts of its length, to suit the requirements of the pattern, and as the whole pattern is printed on the yarns, the machinery required is of a far less complicated aiture than when it is required to pull many yaros of dif ferent colors above the surface of the cloth which forms the basis in order to produce the desired design. minster $C$. are made at Axoinster, in Devonshire, is onanner similar to that in which Turkey C. are manm-
factured. Tufts of worsted are tied to a warp of strong factured. Tufts of worsted are tied to a warp of strong lioen and secured by a linen weft. The process is tedions, and piece, to suit the size of the rooms for which they are required. Ingrain $C$, so called becanso made of only two ply pr thicknesses. The colors are reversed on either side, and the warps as well as the filling nay be cotton or worsted. Philadelphia is the largest mannfacturing city in the U. States of these goods. Thes are made by the Jacqnard attachouent, aod mustly woven on hand-looms. Dutch and Fentian C. are much alike in their manufacture. The patterns adopted are usually atripes. The chain coosists of stripes of woolle yarns of different colors, and the filling is of woo bemp, or cotton. The Printed Felt C. are made of of felting, and the pattern is impriated io colors by means of rollers on which it is cut. Within a few
years the $C$ indostry has developed to such an extent in the U. States, that our production is now larger than that of any other country in the world. Philadelphia alone has 180 estahlishments, producing yearly about $30,000,000$ yards, and one importation froni England, which in 1471 was $2.759,070$ yards, valued at $\$ 2,339,781$, had fallea in 1 vsul to 23,148 yards, valned st $\$ 21,635$.
